## ■ Methodological notes

### ■ Preliminary remarks

This publication contains the results of the financial accounts of the Deutsche Bundesbank for the period from 2011 to 2016. The following notes provide an overview of the subject matter and methodology of these accounts, helping to create a better understanding of these results. Selected results are then discussed.<sup>1</sup>

### ■ Content, objective and purpose of the financial accounts

*Complexity of the national accounts*

In modern, specialised economies, the production process is made up of countless interactions between economic agents and is therefore extremely complex. The statistical recording of these interactions is nonetheless essential for various purposes, including empirical analysis and the provision of information for economic policy decisions. Such data must be recorded systematically and consistently to ensure historical and geographic comparability. The geography, subject matter and time of an economic interest can be collated and made available as macroeconomic data by aggregating economic entities into sectors, transactions into accounts and instruments, and dynamics into time periods. This is the purpose of the national accounts, which systematically record and describe the economic activities of a national economy in the form of standardised accounts.

*Financial accounts as part of the national accounts*

A complex economy consists of the production, distribution and utilisation of goods (real economy) and the corresponding financial activities and intermediation (financial economy). The traditional (real economic) part of the national accounts reflects the goods and services produced during a specific period as well as the associated income. By contrast, the financial accounts – an integral part of the national accounts – reflect financial activities. The results of the financial accounts show who provided or took up financial resources on what scale and in which form in an economy, and which financial intermediaries were involved in the financing cycle.

*Financing ...*

Financing (financial activity) is essentially understood to be the provision of funds for use in financial (intermediate financing) or real economic activity (consumption or investment). In the case of external financing, external funds are raised for this purpose, while for internal financing, recourse is taken to own funds (eg profit).

The acquisition of assets is the counterpart of financing. It essentially comprises financial and non-financial assets, with non-financial assets consisting primarily of real estate and financial assets of financial lending and money creation. From a global perspective, the source for the acquisition of financial assets is therefore always external financing, which ultimately leads to utilisation in consumption and investment. The real economy and financial economy are therefore closely linked.

*... and acquisition of assets*

The starting point for the compilation of the financial accounts is data regarding the acquisition of non-financial assets and the savings of the individual sectors, which are based on the corresponding real economic figures from the national accounts. The balances resulting from the acquisition of non-financial assets, on the one hand, and from saving plus capital transfers, on the other, show to what extent a sector was a lender to or borrower from other sectors (net borrowing/lending) (see chart on page 6). These net lending and net borrowing aggregates correspond conceptually to the balances arising from the acquisition of financial assets and external financing of the individual sectors, the calculation of which lies at the heart of the financial accounts. Any deviations are normally due to statistical discrepancies. The financial accounts therefore provide an impression of the basic structure of the financial system (ie the domestic channels through which financial assets are acquired and financial resources are obtained) as well as the financial behaviour of households, non-financial corporations and general government.

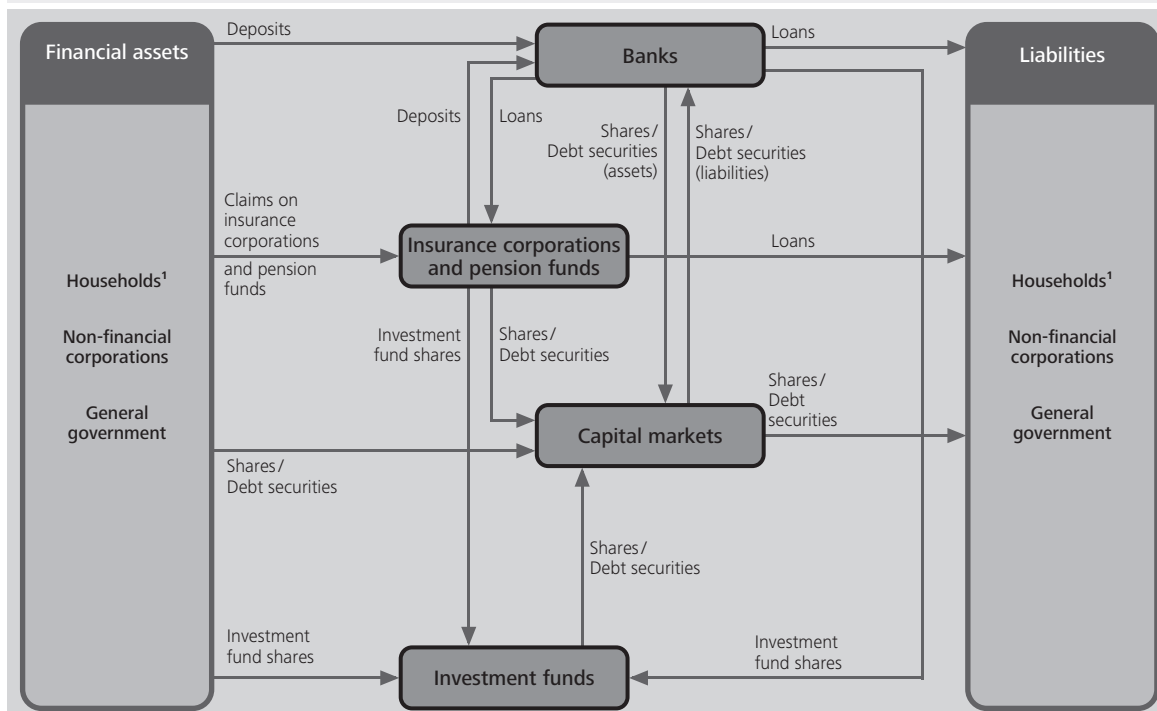

*Linkage of financial accounts and national accounts*

The financial accounts describe aggregate financial transactions during the period under review. Additionally, they record the amount of financial assets and liabilities as of a given date (in the financial balance sheets), thereby contributing significantly to the compilation of sectoral and aggregate balance sheets. This information is necessary for, among other things, analytical purposes in that the

*Financial balance sheets*

<sup>1</sup> In the electronic version of this publication, in principle all of the time series are linked to the macroeconomic time series database on the Deutsche Bundesbank's website. Clicking on one of the time series in this publication will take you to the corresponding time series in the database. For reasons of clarity, certain time series in this publication are only shown in aggregate form, whereas all the components are shown separately in the database. This applies in particular to the data on creditor-debtor relationships. For example, whereas this publication shows the extent to which financial corporations as a whole have issued shares, the above-mentioned database contains separate data on the respective financial corporations (insurance corporations, monetary financial institutions etc).

**Simplified structure of the German financial system\***  
 (including corresponding relationships with the rest of the world)

\* Direction of arrow indicates a claim. 1 Including non-profit institutions serving households.  
 Deutsche Bundesbank

level and structure of financial (and non-financial) assets and liabilities can influence economic behaviours.

Usage

The Bundesbank itself uses the results of the financial accounts to, among other things, study the portfolio structure of non-banks within the context of monetary analysis. Moreover, knowledge of the financing structure and dynamics of non-banks as well as of the respective determinants are helpful with regard to monetary transmission. The Bundesbank's interest is mainly focused on the relationship between the credit operations of domestic banks on the one hand and on the other sources of funding (such as securities markets, other financial intermediaries, insurance corporations and foreign lenders) on the other. Its aim is, inter alia, to uncover the links between the credit and securities markets. In this context, it also examines questions concerning the development and sustainability of (sectoral) debt. The Bundesbank – in addition to its business cycle analysis – looks at the pattern of asset acquisition and financing of enterprises and households in connection with real economic variables of the national accounts (especially capital formation and saving).

The United Nations created the System of National Accounts (SNA)<sup>2</sup> in order to establish consistency and stand-

ardisation at an international level. Within the European Union (EU), a more detailed version with specific definitions is required to manage and monitor economic and monetary union. The European System of Accounts (ESA)<sup>3</sup> satisfies this requirement and provides a standardised methodological framework that is prescribed to all EU member states by directive.<sup>4</sup> It essentially contains the integrated components of domestic output, distributive and capital transactions and input-output accounts, and includes the definitions and characteristics of transactions, economic entities etc that are needed to prepare the standardised EU national accounts (and therefore also financial accounts). ESA allows financial and real economic flows to be reported consistently in their entirety on a consistent basis and used for analytical purposes.

Statistical systems: SNA and ESA

<sup>3</sup> For the differences between ESA 2010, in force since 1 September 2014, and the 2008 SNA, see ESA 2010, section 1.51.

<sup>4</sup> See Regulation (EU) No 549/2013 of the European Parliament and of the Council of 21 May 2013 on the European system of national and regional accounts in the European Union.

*Development of the financial accounts in Germany*

The Bundesbank began to develop national financial accounts data very early on. The first publication appeared in 1955.<sup>5</sup> Since then, financial accounts data have been commented on in various Bundesbank publications. In the course of further developing the original statistics, stock data on financial assets and liabilities of the individual sectors were published for the first time in 1971. Since then, financial balance sheets have been part of the standard publication programme.<sup>6</sup> The complete annual financial accounts appear at regular intervals as a separate Special Statistical Publication. Since the beginning of 2007, the current quarterly data for the sectors households and non-financial corporations have been published in the statistical section of the Monthly Report. Additionally, the corresponding data for these and other sectors can be found in the time-series database on the Bundesbank's website.<sup>7</sup>

*Results based on ESA 2010*

This publication shows the annual results of the financial accounts for the 2011 to 2016 period. The data on financial flows and stocks contained in this publication have been compiled according to ESA 2010, which replaced the previous ESA 1995 on 1 September 2014. Owing to the associated methodological changes, the results of this edition of the Special Statistical Publication can only be compared to a very limited extent with those of previous editions, which are based on ESA 1995 data.<sup>8</sup>

## ■ Methodological structure

### Basic principles

*Financial assets and liabilities*

The financial accounts form a closed-loop system. Consequently, total assets equal total liabilities. Transactions are divided into acquisition of financial assets and external financing, and stocks into financial assets and liabilities. The terms "financial assets" and "liabilities" are defined broadly. Financial assets are classified as any asset that pertains to a creditor-debtor relationship, with the creditor having a legally enforceable claim on the debtor. Besides direct creditor-debtor relationships, they include financial operations in the form of shares and other equity, claims on insurance corporations and on the rest of the world, and central bank holdings of "financial gold" (this position in the financial accounts results from currencies formerly being backed by gold through fixed pegging against the US dollar until the end of the Bretton Woods system; gold holdings of other sectors are classified as non-financial assets).

### Sectoral breakdown

The financial accounts show the financial relationships between all economic entities permanently domiciled in Germany (residence concept). Foreign employees and the production sites of foreigners in Germany are thus treated as domestic economic entities (sector S.1), whereas German facilities domiciled abroad are regarded as non-residents and are thus assigned to the sector Rest of the world (sector S.2). Domestic entities are grouped in institutional sectors according to their economic and financial nature (see overview of sectors on page 8). Here, a unique classification into the main and sub-sectors of the national accounts is not always possible, as economic entities may engage in multiple activities. Classification is consequently based on their primary function or their primary behaviour. Because of the creditor-debtor relationship of financial assets and liabilities, each creditor sector has a counterpart debtor sector.

*Residence concept and classification by sector (S)*

The primary function of economic entities in the sector Non-financial corporations (sector S.11) is to produce (real) goods and services for the market. Consequently, their task is to identify and invest in economically advantageous projects. The sector Non-financial corporations includes genuine corporations (public limited companies, private limited companies etc) and quasi-corporations (chiefly partnerships, ie general partnerships and limited partnerships).

*Non-financial corporations (S.11)*

By contrast, the main task of the economic entities in the sector Financial corporations (sector S.12) is to provide financial services. This sector is disaggregated into monetary financial institutions (MFIs, sectors S.121-S.123), investment funds (except money market funds, sector S.124), other financial intermediaries (OFIs) including financial auxiliaries, captive financial institutions as well as money lenders (sectors S.125-S.127), and insurance cor-

<sup>8</sup> For a more detailed description of the changes in the financial accounts following the adoption of ESA 2010, see Deutsche Bundesbank, Methodological changes in the financial accounts – background, approach and selected results, Monthly Report, October 2014, pp 13-26.

## Sectors of the financial accounts

<sup>1</sup> Including financial auxiliaries as well as captive financial institutions and money lenders.  
 Deutsche Bundesbank

corporations and pension funds (sectors S.128-S.129). The Bundesbank is included in the MFIs sub-sector as a central bank, along with commercial banks, building and loan associations and money market funds, which are included as other MFIs. In this sub-sector, money is created through lending and the collection of deposits from money-holding economic entities (households, non-financial corporations etc). Investment funds (except money market funds) comprise all entities that collect funds by issuing investment fund shares and primarily invest these funds in financial assets and tangible fixed assets (generally real estate). The OFIs sub-sector encompasses financial institutions that neither create money, nor are they able to provide insurance services, and are also not investment funds (eg securities dealers, financial leasing corporations, captive money lenders, financial vehicle corporations, issuing houses). Insurance corporations whose main focus is the assumption of risk relating to premium payments and the formation of insurance technical reserves, together with pension funds (supplementary pension funds for government employees, occupational pension schemes etc), form a sub-sector of their own.

*General government (S.13)*

The primary focus of the sector General government (S.13) is the fulfilment of sovereign tasks in line with the principles of republic, democracy and constitutional, social and federal government. It comprises the subsectors central, state and local government and social security funds. General government's main source of financing is compulsory payments (taxes, fees and contributions) and borrowing via financial markets. The supplementary pension funds for public-sector employees fall within the scope of the (private) insurance sector.

The sector Households (sector S.14) includes all persons or groups of persons who are characterised primarily by the consumption of real and financial goods and services. It also includes (since ESA 95) persons or groups of persons who produce market goods and/or services, insofar as no quasi-corporations were formed for this purpose.<sup>9</sup> Consequently, sole proprietors, independent professionals, self-employed farmers etc also belong to this sector.

*Households (S.14)*

Non-profit institutions serving households (sector S.15) are institutions which constitute independent legal entities that serve households as private other non-market producers. These include, for instance, political parties, trade unions and churches.<sup>10</sup>

*Non-profit institutions serving households (S.15)*

Residents' assets and liabilities vis-à-vis non-residents are offset in the sector Rest of the world (S.2). Only the basic financial relationships with non-residents are shown; non-residents are not divided into individual sectors. Consequently, only those asset positions arising from links between residents and non-residents are shown in this sector. The total asset and liability position of non-residents can only be determined based on the results of all foreign financial accounts.

*Rest of the world (S.2)*

<sup>9</sup> This group of persons was re-classified to the sector Households upon the entry into force of ESA 1995 mainly because it was felt that the relevant entrepreneurial activities were not being recorded adequately for statistical purposes and that they would be better reflected under other private lifestyles. For more detailed information, see Deutsche Bundesbank, Overall financial flows in 1999, Monthly Report, June 2000. ESA 2010 has not altered this classification.

<sup>10</sup> Non-profit institutions serving households, which were always recorded together with households under ESA 95, have been shown separately since the introduction of ESA 2010.

## Recording of financial instruments

*Instruments used for financial transactions and stocks (F)*

Within the sectors, economic entities are structured according to their primary economic operations. These (financial) operations are, in turn, broken down according to various instruments. By analysing activities, conclusions can be drawn regarding the objectives of entities within the sectors. The instruments are therefore structured according to their liquidity (tradability), maturity and legal characteristics (see the adjacent classification of instruments). Owing to the creditor-debtor relationship, creditor and debtor positions exist for each instrument. In the financial accounts, the definitions of financial instruments are independent of the creditor or debtor sectors involved.<sup>11</sup> Therefore, the different categories of deposits also include the balances of domestic sectors with foreign banks. Similarly, the item Loans comprises not only loans granted by banks and building and loan associations, but also unsecured lending by other sectors (eg mortgages and other loans granted by insurance corporations or general government).

*Monetary gold and special drawing rights (F.1)*

Monetary gold (financial gold, F.1) is gold held by central banks. It is part of the country's international reserves. Special drawing rights (SDRs) are currency units defined and maintained by the International Monetary Fund (IMF), which are covered by the most commonly used international currencies. They are used as a means of settlement between central banks and international institutions.

*Currency and deposits (F.2)*

Currency comprises the banknotes issued by the central bank and coins in circulation. Generally speaking, currency is a liability of the institutional sector that issues it. As a modern form of debt money, banknotes are a liability of the central bank. By contrast, coins are a government liability in many countries, including Germany, due to the "coin prerogative". Deposits are deposits at MFIs, which are either directly available (transferable deposits) or available after a fixed term or period of notice (other deposits). Currency and transferable deposits are used mainly as payment instruments for real economic or financial transactions, ie as direct payment methods. Savings and time deposits, by contrast, are chiefly used for savings, with short-term ones considered potential means of payment given their "near-money" status.

*Debt securities (F.3)*

Debt securities (F.3) comprise borrowed capital that has been converted into negotiable securities through securi-

<sup>11</sup> The breakdown by maturity is based on the life or the period of notice originally agreed. Claims or liabilities repayable on demand or in one year or less are normally classified as short-term, while those with longer maturities are deemed to be long-term.

tisation. They can be traded on the market and are subdivided into short-term and long-term debt securities. Financing with an original maturity of up to one year is deemed short-term, whereas financing with an original maturity of more than one year is deemed long-term.

*Loans (F.4)* Loans (F.4) are unsecuritised assets which, unlike securities, are not directly tradable. Based on their original maturity, they are broken down into short-term (maturity of up to one year) and long-term loans.

*Shares (F.5)* Shares (F.5) comprise ownership rights in corporations. This equity generally enables the owner to influence corporate decisions. Shares first and foremost include direct holdings of shares, irrespective of whether or not they are listed. They also include shares in Other corporations (private limited companies and cooperative societies) and in partnerships. Substantial capital is tied up in such companies in line with the corporate structure in Germany. Finally, investment fund shares are also included in this category.

*Claims on insurance, pension and standardised guarantee schemes (F.6)* Claims on insurance, pension and standardised guarantee schemes (F.6, also referred to as insurance technical reserves) mainly encompass claims arising in connection with possible future events. These usually relate to insurance corporations and pension funds as debtors. However, in the case of employers' pension commitments in connection with company pension schemes, the liability remains in the relevant debtor sector, eg Non-financial corporations. Claims on social security funds (state pensions) are not covered in the financial accounts.

*Financial derivatives and employee stock options (F.7)* Financial derivatives (F.7) are financial instruments based on another instrument which allow special risks to be traded separately from the underlying instrument. Their value is derived from an underlying instrument, which can either be another financial asset (eg options on securities), an index (eg DAX futures), a commodity (eg commodity futures) or an event (eg credit default swaps). Employee stock options entitle employees to acquire a certain number of stocks of their employer at a pre-determined price, either at a fixed point in time or within a certain time-frame.

*Other claims and liabilities (F.8)* Other claims and liabilities (F.8) comprise financial operations that tend to be the counterparts of other business activities, eg early or late payments for goods and services. These items include enterprises' trade credits and prepayments/accrued income as well as government tax claims and payment arrears. With respect to the sector Households, other claims also include accumulated

interest-bearing surplus shares with insurance corporations.

## Covering the dynamics

The financial instruments which are held and issued by the sectors are measured over time periods and at specific points in time. Flows (transactions) encompass the issue, exchange, transfer or utilisation of financial assets or liabilities over a period of time, whereas stocks reflect these values at a particular point in time. As a rule, financial transactions and their counterpart entries are recorded at the same time. *Stocks and flows*

The financial accounts document the financial stocks and flows of the various sectors on a quarterly basis. The data are published regularly at quarterly intervals and this Special Statistical Publication, which contains annual data, is produced once a year. The time lag between the reporting date/period and publication is at present about three-and-a-half months and is mainly used for the compilation and verification of the data. *Reporting periods and frequency*

## Conceptual aspects

Economic entities may interact, and thus carry out financial transactions, with entities within the same sector or with those from other sectors. The unconsolidated approach takes into account transactions which take place within one sector. This reflects the overall activity of the sector. Under the consolidated approach, the financial relationships within a particular sector are offset against each other to produce consolidated data. This approach illustrates the external relationships of a particular sector with other sectors. The difference between the unconsolidated and consolidated accounts is attributable to the internal relationships and activity. This enables a more detailed analysis of the functions and links between financing and the acquisition of assets, particularly within the heavily disaggregated financial sector. For the individual sectors unconsolidated data are published in this Special Statistical Publication. However, the data in the matrices from page 60 onwards are consolidated and therefore illustrate the external relationships of the individual sectors. *Consolidation*

The financial accounts aim to reflect transaction values at market prices, as these contain implicit information on the subjective valuation of stakeholders. Financial flows are therefore valued at actual transaction prices. In practice, this principle is sometimes difficult to apply in cases in which stocks are to be shown at market prices rather than at their nominal value. The transaction value principle can be applied without any problems wherever turnover stat-

*Valuation of flows ...*

istics are available, for instance in the case of issuance of securities at issue prices. If, however, the figures on the transactions are derived from stock data which include re-valuations, the valuation concept can only be applied using separate calculations that eliminate valuation changes that have occurred over time. This, in turn, requires the availability of additional suitable statistics, from which the necessary information can be taken. If such data are not available, or only available to a limited extent, estimates have to be used.

counts. As a consequence, existing statistical information which primarily serves other purposes always has to be used in compiling them. A case in point is the banking statistics, which are collected by central banks primarily in connection with performing their monetary policy and supervisory functions. The same applies to securities statistics for analysing the capital market and to various statistics for compiling the balance of payments. The financial accounts therefore assume the character of secondary statistics which are based on statistical components from diverse financial areas which are linked consistently with one another.

*Financial accounts as secondary statistics*

*... and of stocks*

The predominant criterion for valuing stocks is also market prices (or at least estimated near-market prices). In the case of financial operations in the form of securitised creditor or debtor relationships (or equity) and in foreign currency, daily market prices quoted in the securities and foreign exchange markets are used. In the case of unsecuritised claims and liabilities in domestic currency, however, these largely correspond to nominal values.

The information for compiling the financial accounts can be obtained either directly or indirectly. In the first case, the data stem directly from the institution for which they are needed, in other words, from households or enterprises themselves. The second option is to obtain the desired data indirectly – ie from other sources, for example credit institutions or other financial intermediaries. Both methods have advantages and drawbacks. The direct method is often impeded in practice by considerable psychological resistance, legal hurdles and high costs. On the other hand, the indirect method used in Germany has the advantage that one can draw on existing statistics which, on account of legal regulations, are usually sufficiently detailed, comparatively dependable and available without too great a time lag. The disadvantage of this method is that these statistics do not necessarily meet the specific requirements of ESA. In such cases, statistical procedures and adequate additional information are used in an attempt to fill the gaps. Because the resulting statistics are estimates, the results should be interpreted with caution, however, as is the case with the item Other equity in Germany, for example. If there are no well-founded points of reference, as with employee stock options, no explicit information is shown.

*Indirect information*

*Valuation-related differences*

The use of market prices for valuing financial flows and stocks leads to flow-stock discrepancies which, in the case of securities and external positions, may be significant. In such cases, a seamless match between the recorded financial transactions and the changes in the stocks can only be achieved via an additional reconciliation account showing the audit trail between the initial position, transactions, valuation changes and the final position.<sup>12</sup>

*Net recording*

Financial flows are shown net in the German financial accounts, ie the increases in claims (or liabilities) of a specific type are offset against the relevant decreases in the period concerned. This representational concept is in line with ESA 2010, but also arises inevitably from the fact that stock statistics frequently have to be used in order to derive the financial flows.

*Consistency*

The system of double-entry bookkeeping in the financial accounts results from creditor-debtor relationships. All assets are therefore matched by counterpart liabilities, broken down by instrument and sector and sub-divided according to transactions and stocks. The monetary assets of one party are the monetary liabilities of another. This requires consistency of data. The totals of the relevant balance sheet items for instruments and sectors must match. This consistency applies to both the result of the financial accounts and the sources and procedures used and thus constitutes a special requirement.

The most important sources for the financial accounts are the statistics of financial intermediaries, particularly the monthly balance sheet statistics of banks (MFIs), the securities holdings statistics and the quarterly data on the financial position of insurance corporations. The bulk of the stock data come from these sources, which often also indicate the sectors in which the claims shown are concurrently incurred as liabilities and, conversely, the liabilities accrue as claims. Further data are provided, for example,

*Main sources*

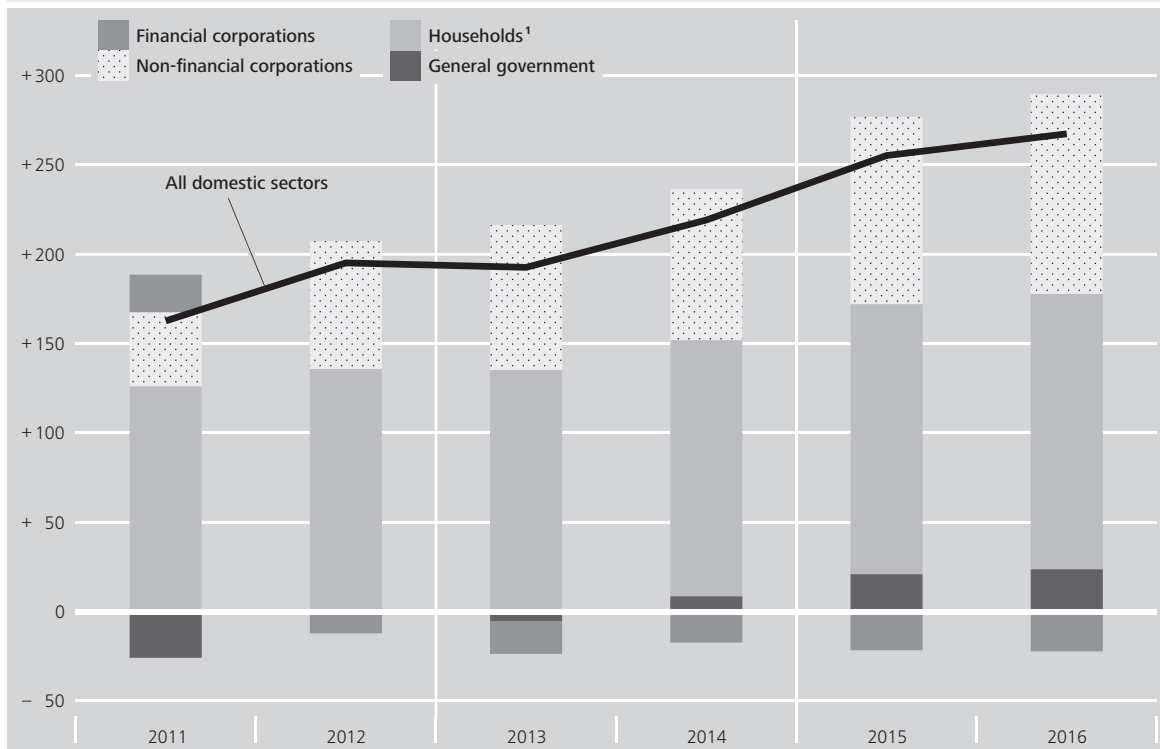

## Statistical sources

Worldwide, there are hardly any separate collections of statistics for the specific purposes of the financial ac-

<sup>12</sup> Discrepancies between flows and stock variables can also arise as a result of reclassifications within a sector at the instrument level or a change in the allocation of individual units to an institutional sector. However, such reclassifications occur only irregularly and are usually minor.

### Net lending/net borrowing by institutional sectors

€ billion

<sup>1</sup> Including non-profit institutions serving households.  
 Deutsche Bundesbank

by the capital market statistics, the balance of payments statistics, the international investment position, corporate financial statement statistics and various government financial statistics.

### Compilation

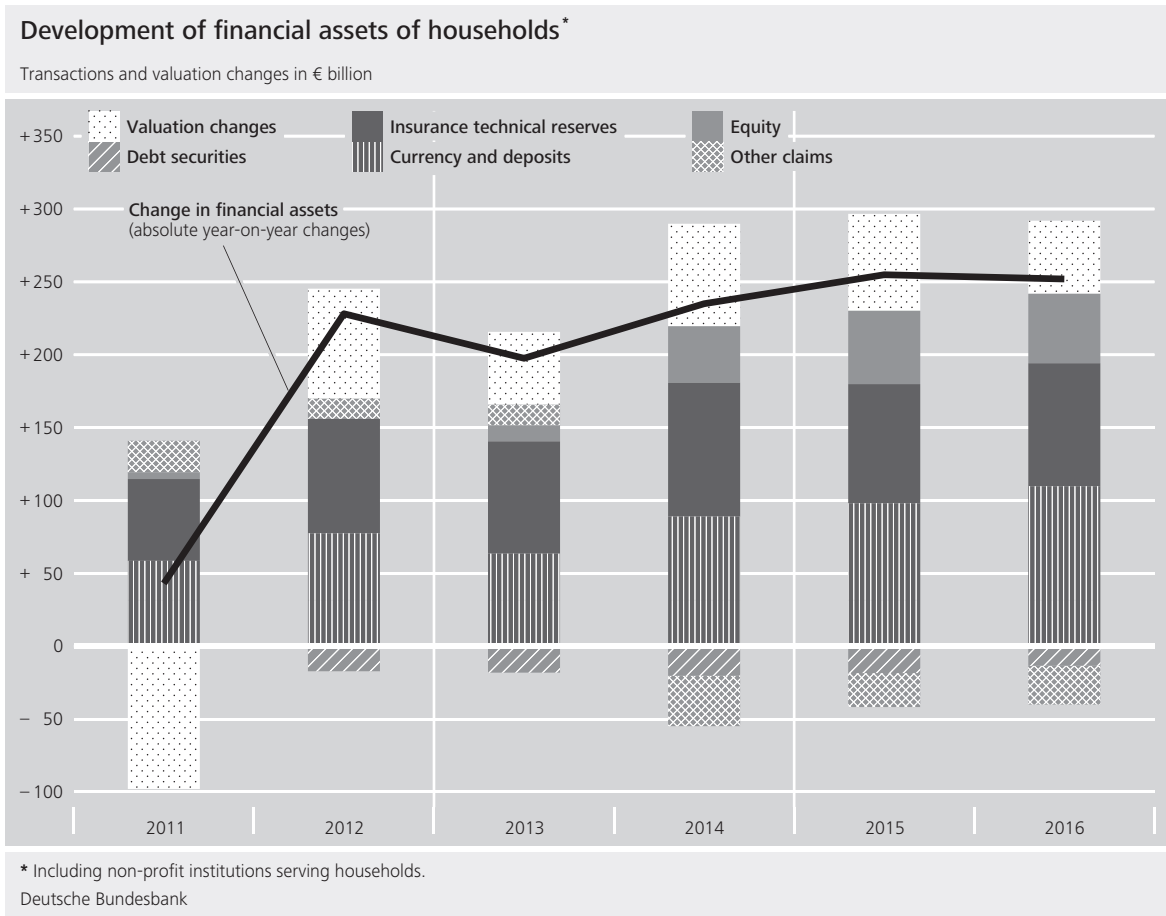

*Financial accounts process*

The financial accounts statistics are generally compiled according to the bottom-up principle, ie data for the top sector are calculated summing up available data for the sub-sectors and sub-categories of financial instruments. Where this is not possible owing to incomplete sub-account data, data from higher accounts are disaggregated for the lower accounts according to the top-down principle. Owing to the varying degrees of reliability and temporal availability of primary statistics, data are compiled according to a hierarchy of sources for the selection of data sources to calculate the various instruments and sectors. This is based on the objective of capturing, above all, the domestic sectors accurately. Discrepancies that exist between individual data sources owing to the use of different methods in collecting data are compensated in part via the external account. At the same time, the consistency of instruments (horizontal consistency) and sectors (vertical consistency) is checked and ensured. In the

case of vertical consistency, the consistency of the real-economic national accounts and financial accounts (sectoral balances) is verified.

The results of the financial accounts are revised from time to time. Such adjustments, which are also implemented retroactively, are essentially made for any of three reasons. First, changes in the data of the primary statistics used are taken into consideration in this way. Revisions of this kind can become necessary due to changes in the source classification, definitions or the classification of economic entities. Second, as the availability of suitable primary statistics changes over time, the additional inclusion of new or the replacement of previous data leads to revisions of the financial accounts. It is necessary to take such changes in the primary statistics into consideration in the financial accounts to ensure the consistency, up-to-dateness and high quality of the data and of the information contained therein. Third, methodological changes in the financial accounts themselves – such as the conversion to ESA 2010, which was completed in the autumn of 2014 – necessitate revisions.

*Revisions*

## Selected developments over the years 2011 to 2016

*Net lending of households ...*

The chart on page 12 shows net lending/net borrowing by institutional sectors for the period from 2011 to 2016 according to the national accounts data. It points to consistently high net lending for households, in particular. Such situations are frequently observed in highly developed economies. Net lending is regularly recorded in this sector in other euro area countries, too. One of the reasons for the increase in net lending observed in Germany over the past few years is that disposable income has been growing relatively fast since 2011; it has visibly outpaced growth in private consumption, especially since 2014. The resulting increase in savings was not fully channelled into additional net investment (typically in housing construction), which means that net lending has been rising moderately throughout virtually the entire period since 2012.

*... and non-financial corporations*

A similar situation has been observed among non-financial corporations. Although compensation of employees has risen markedly in the past few years, savings exceeded net investment and thus led to net lending. All in all, net lending went up again in 2016 – a development which can be observed for quite some time now. One of the reasons for

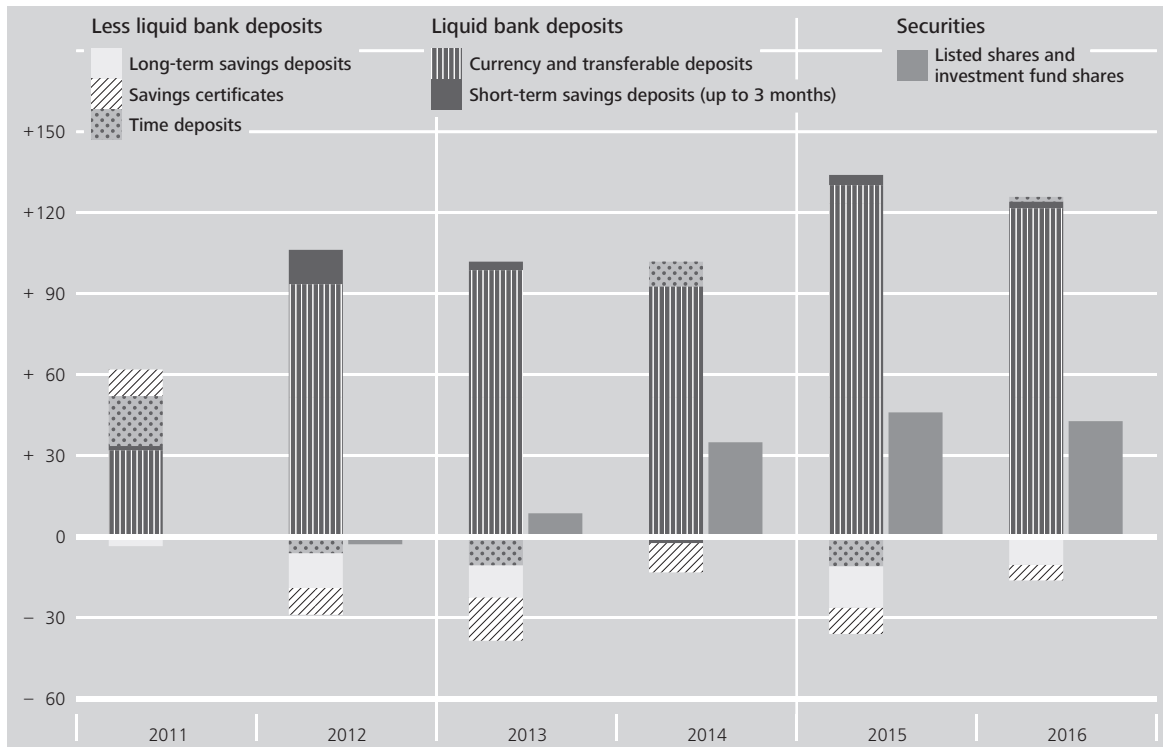

this is probably the, on the whole, stable earnings position in the past few years in combination with robust investment income growth and more moderate distributions. Falling energy prices are also likely to have made a positive contribution in this context.

Primarily the rest of the world, and in the years 2011 to 2013 also general government, were the counterparts to net lending in domestic private sectors. In the years under review, the general government financial position saw a steady decline in the government deficit. Whereas the deficit had been comparatively high in 2011 – the expenditure, which was partly attributable to crisis-induced measures taken to stabilise the financial sector and to stimulate the economy, exceeded revenue, which tended to be low – it receded considerably in subsequent years against the background of a sustained positive macroeconomic environment. As of 2014, it was transformed into a surplus, which has increased continuously since then. The surpluses here are largely the result of favourable tax revenue patterns, lower interest expenditure and, more broadly speaking, positive developments in the labour market. The (high) savings surplus of the domestic sectors which followed in the period observed was channelled abroad, building up high current account surpluses ac-

 Deutsche Bundesbank

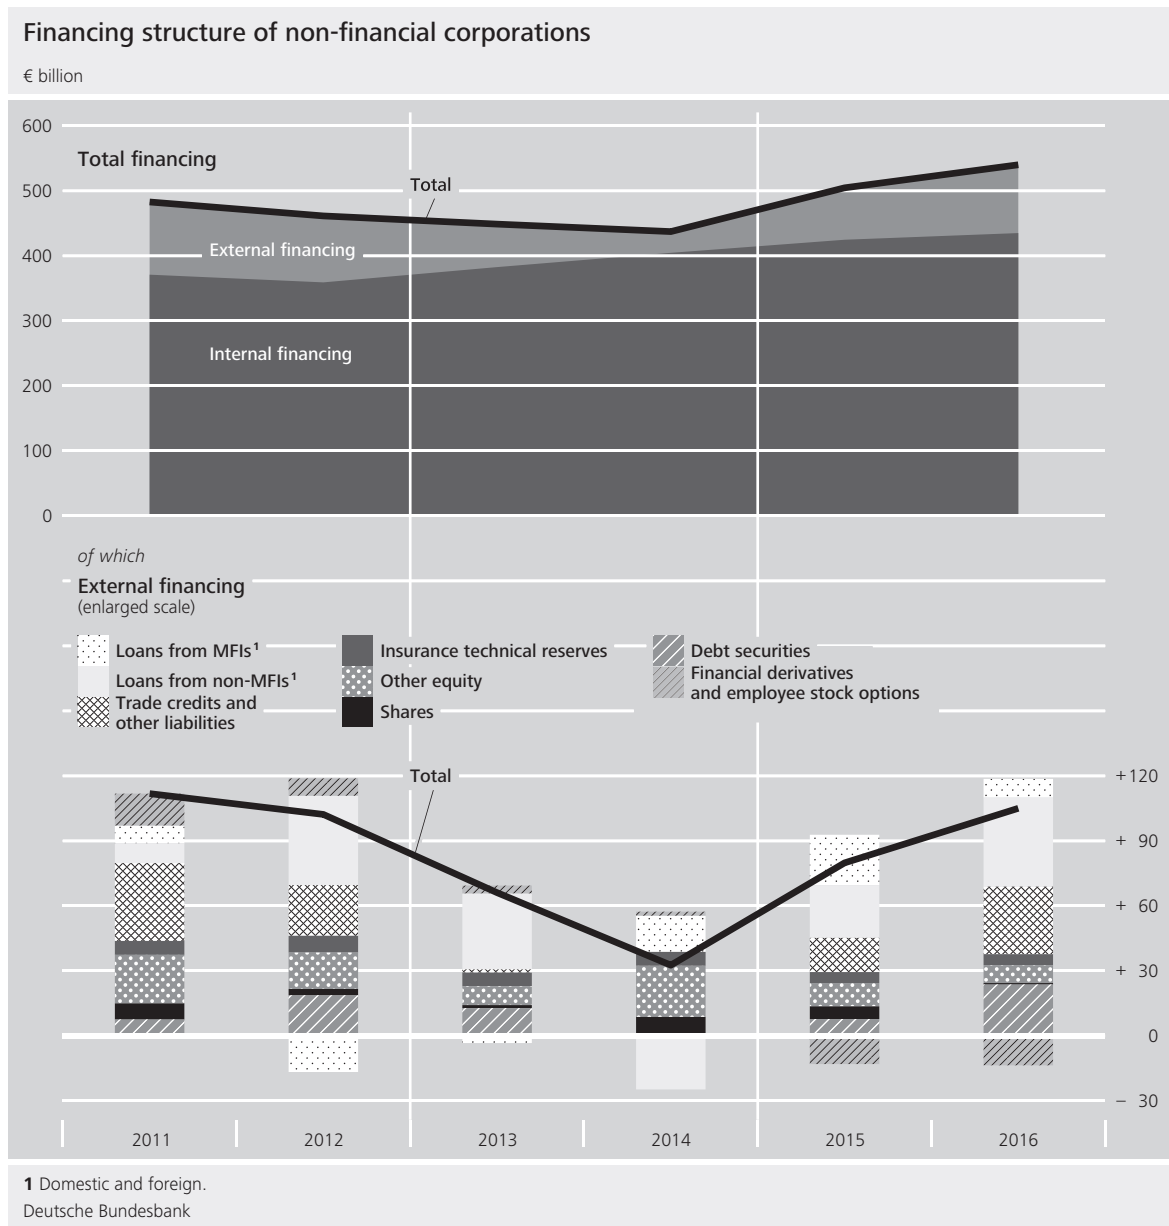

According to the national accounts data. In 2016, the surplus came in even higher than in the already strong previous years, the primary reasons for the rise being the distinct decline in energy prices and the depreciation of the euro.<sup>13</sup>

*Increasing yield consciousness despite households' preference for low-risk and liquid forms of investment*

The financial assets of households (including non-profit institutions serving households) rose to their all-time high of around €5,757 billion by the end of 2016. At the same time, liabilities rose at a significantly slower rate, causing the rise in financial assets to translate into an increase in net financial assets. Since 2011, there has been a rise of more than €1,000 billion overall, with valuation effects accounting for roughly one-fifth of this increase. Households invested that part of the saving (including net capital transfers received) which exceeded net investment (including acquisitions less disposals of non-produced assets), as in the years before, primarily in asset forms considered to be particularly liquid and low-risk. The chart on page 13 shows the development of financial assets of households in the period from 2011 to 2016. The investment of financial assets with banks and insurers has played a dominant role throughout. Over the 2011 to 2016 period, households showed a pronounced preference for liquidity, which manifested itself in considerable inflows of funds to

transferable deposits and cash. Longer-term time and savings deposits, by contrast, were barely accumulated any further or were even depleted in net terms (for more details, see also chart above). Likewise, claims against insurers and pension funds saw significant inflows. As these claims, especially the bank deposits, are deemed to be low-risk, the fact that they are very significant with respect to the acquisition of financial assets suggests that households are highly risk-averse. Since 2014, however, this risk aversion seems to have diminished compared with previous years. Safer and more liquid financial assets usually generate lower yields, which is particularly noticeable in times such as the current low-interest-rate setting. Against this background, signs have been emerging since 2014 that shares and investment fund shares – and thus, on the whole, higher-risk and higher-yielding investment vehicles – have gradually been gaining in importance for financial investment. This development continued in 2016 as well (see chart above). While inflows for insurance claims failed to show any further growth in this period, sight deposits, by contrast, were accumulated further and

<sup>13</sup> Aggregate net lending/net borrowing largely corresponds to the current account balance plus the capital account. Any deviations are normally due to statistical discrepancies.

did not underline an increasing yield consciousness. Therefore, it can be assumed that a preference for liquidity is still present given its very significant role in the acquisition of financial assets (see chart on page 13). Overall, yield considerations appear to have become more important for households in Germany recently; the traditional behavioural patterns have not been put aside completely, however.

equities and investment fund shares, among the latter in particular equity funds and mixed securities funds. These gains, seen in isolation, coincided with more and more investors turning to market-based investment vehicles, which is likely to have accelerated the increase, visible since 2014, in their significance with respect to the acquisition of financial assets.

*Households benefit from valuation gains on capital markets*

Apart from transaction-based inflows of funds, the development of financial assets also consists of valuation effects, which are depicted in the chart on page 13. Whereas in 2011 households recorded marked price losses amid uncertainty about where the euro area was headed, they have consistently notched up significant valuation since 2012. This development was mainly due to gains on listed

By contrast, the external financing of non-financial corporations between 2011 and 2016 developed comparatively positively, as shown in the chart on page 16. External financing initially remained at a stable level as the economic situation improved in the aftermath of the financial and economic crisis before temporarily weakening considerably in 2014. One of the reasons for this was heightened uncertainty about the state of the world economy; lend-

*External financing of non-financial corporations dynamic*

ing by non-residents, in particular, fell off significantly. A host of factors presumably aided and abetted the subsequent stable development. One was the tailwinds provided by demand for investment funding, according to the Bank Lending Survey; in a limited number of cases, this led to existing loan agreements being renegotiated. Another was that, in isolation, the interest rate level, which dropped once again amidst the asset purchase programme launched by the Eurosystem in early 2015, stimulated demand and recently increased the funding needs for mergers and acquisitions as well as corporate restructuring. Loans were a major source of funds throughout the period under review. Aside from banks, other entities (including insurance corporations and other financial intermediaries) played a key role in the provision of funding. Trade credits, too, made a stable and, in some cases, considerable contribution to funding in the past few years. By contrast, market-based financing played a minor role in

the years since 2011 but has remained relatively stable compared with loan-based financing. However, the contribution of financing via debt securities increased particularly of late, which was probably also due to the fact that the financing environment in the bond markets has tended to be favourable over the past few years.

Total financing comprises internal financing – ie financing via retained profits – and external financing. Between 2011 and 2016, it recorded similar overall growth to external financing. However, external financing mostly accounted for 15% to 20% of total financing; only in 2014 was it significantly lower in the light of the above-mentioned decline in external financing, but it recently stabilised at around 19%. By contrast, against a background of robust overall earnings trends, the proportion of internal financing remained consistently at a high level.

*Internal financing accounts for the bulk of total financing*
