# The Economic Situation in the Area of the German Federal Republic in February and March 1953

# Money and Credit

Lendings, Acquisitions of Securities, and Purchases of Foreign Exchange by the Banking System

The short-term lendings to business and private customers have continued to grow to only a relatively small extent. At the 480 institutions rendering weekly returns, which account for about 70 per cent of all the short-term lendings in this category, the increase during the period from 15 February to 15 March 1953 amounted to DM 235 million, as compared with DM 423 million in the corresponding period of the previous year. As between the individual weeks in this period the movement showed great divergence.1) Thus, during the last two weeks in February the volume of credit expanded only very slightly, and in the first week of March it contracted; but in the second week of March, as usual, the quarterly date for payments on the Assessed Income Tax and the Corporation Tax led to a considerable increase in the demand for credit from trade and industry. Even in that week however the increase, at DM 217 million, fell short of the rise in the corresponding week a year before.

If one looks at the figures of the short-term lendings to business and private customers at the credit institutions rendering monthly returns, at which nearly the whole volume of credit is concentrated, although provisional figures are available only up to the end of February, one obtains confirmation of the impression given by the weekly sample statistics, namely that there continues to be a moderate expansion of credit. At these banks the short-term lendings to business and private customers rose during February by DM 356 million, whereas the increase in the corresponding month of last year was DM 526 million. It is almost solely the lendings on current account which have grown during the last few weeks, the volume of discount credits having

remained virtually unchanged, while that of the acceptance credits showed a further slight fall.

Recently there has been only slight alteration in the amount of the credits extended by the banking system to public authorities. An increase in these credits during February was followed by a slight decrease in the first half of March, so that, as will be seen from the table, the absolute level at the middle of that month was only slightly above that at the end of January. The amount of the short-term credits

taken by public authorities from the Central Banking System and the commercial banks together, at a total of about DM 1,400 million, continues to be small; these credits indeed represent only some 7 per cent of the total volume of short-term credits. About three-quarters of the short-term credits extended by the commercial banks to public authorities consist of in-

<sup>1)</sup> See table IV on page 53 in the Statistical Section.

vestments by those institutions in Treasury Bills and non-interest-bearing Treasury Bonds, among which securities those of the Federal Railways and the Federal Government are much the most important. This portion of the bank credits extended to public authorities thus has rather the character of reserves of liquidity in the banks' hands; and this accounts for the fact that the distribution of these credits as between the Central Banking System on the one hand and the "market" on the other, the latter consisting in particular of the commercial banks, varies according to the situation on the money market (see in this connection the section of this Chapter on the money market and the liquidity of the banks).

Recently, as the result of seasonal influences, the rate of growth in bank lendings at medium and long term has further declined. During February, according to a provisional compilation of the reports from the banks rendering monthly returns, these lendings rose by only DM 370 million, whereas in January they increased by DM 457 million1), and their monthly average rise during the fourth quarter of 1952 was as much as DM 636 million. The fact that during the winter months only relatively small amounts are paid out in respect of medium- and long-term lendings is mainly due to the way in which the weather limits building activity, with resulting delay in completion of the projects for which the loans are granted. Even so, in harmony with the large increase in the formation of monetary capital at the banks (see in this connection the section on saving), the expansion in bank lendings at medium and long term in February of this year was greater than that in February of last year, when the increase in such lendings amounted in fact to DM 230 million only.

During the period under report comparatively slight changes also took place in the other long-term investments of the credit institutions, including in particular — apart from equalisation claims—their holdings of securities. At the banks rendering monthly returns the security holdings increased during February by only DM 26 million. At the same time their holdings of loans and non-interest-bearing Treasury Bonds of the Federal Government and the Lands actually

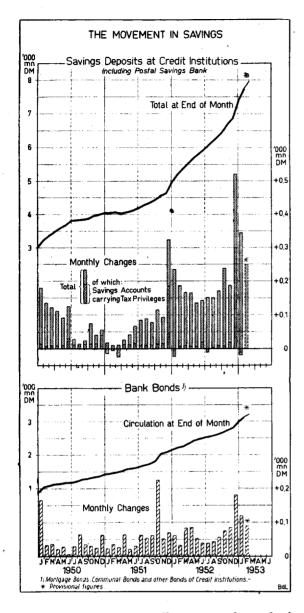

showed a slight decline, falling by DM 9 million to a total of DM 539 million.

On the other hand, there has of late again been a very considerable excess of out-payments in respect of purchases and sales of foreign exchange by the banking system, including the Bank deutscher Länder. This excess amounted in February to about \$ 64 million, or DM 270 million, which compares with \$ 45 million in January, and a monthly average of § 22 million from October to December 1952. In fact the Bank deutscher Länder alone showed an excess of out-payments which was even a little larger still, whereas the foreign exchange holdings of the private Foreign Trade Banks, which serve in the main to cover their liabilities in respect of credits opened in foreign countries, and which had declined by a total of \$ 80 million already during 1952 owing to the decrease in such liabilities, continued their downward movement, although only to a slight extent: The excesses of out-payments continued during the first half of March, amounting to DM 82 million at the Bank deutscher Länder during that period.

### Saving

Saving continued to be very active during the period under report. At the 480 credit institutions rendering weekly returns, which manage about 50 per cent of all the savings deposits at credit institutions, the savings deposits showed a rise in February of DM 136 million, as compared with DM 99 million in February 1952; and in the first half of March they further increased by DM 68 million, as against an increase of DM 51 million in the corresponding period a year before. According to provisional reports the savings deposits as a whole, that is to say, at the credit institutions rendering monthly returns, including the Postal Savings Bank, rose by DM 256 million in February; this compares with a monthly average rise of only DM 173 million during 1952, if the month of December, which was affected by special circumstances, is excluded. It is true that DM 18 million of the February increase consisted not of surpluses of inpayments, interest credited, or other "genuine" additions, but of amounts credited in respect of old RM savings balances of expelled persons, the amounts so credited being thereby brought up

<sup>1)</sup> After elimination of changes due to statistical causes.

to a total of DM 64 million as at the end of February.

Recently the placings of securities have also continued to be comparatively good. They reached a total of DM 117 million in February 1953, as compared with a monthly average of DM 91 million in the year 1952, excluding December. To go into detail, DM 87 million of this amount consisted of bonds of credit institutions, that is to say, mainly mortgage bonds and communal bonds; DM 4 million consisted of industrial bonds; DM 17 million of public loans; and DM 9 million of shares. As regards the parties acquiring these securities it is remarkable that "business enterprises", which also in-

clude private insurance institutions, have of late been taking securities to a much greater extent than before. According to sample statistics which have been collected by the Bank deutscher Länder and the Land Central Banks regarding the placings of securities according to categories of takers, which sample covers 80 to 90 per cent of all sales of fixed-interest-bearing securities with the exception of loans of public authorities, 48 per cent, or nearly one-half, of all the fixed-interest-bearing securities placed in February 1953 were acquired by "business enterprises", whereas on the average of the year 1952 only 20 per cent of the total went to takers in that category. On the other hand the proportion of the securities acquired by public authorities declined to roughly the same extent, amounting in February 1953 to only 46 per cent, as against an average of 72 per cent in the year 1952. True, it is necessary to bear in mind when utilising the classification of takers which is applied in these statistics to rather a very large part of the fixed-interest-bearing securities placed, that only the first takers are recorded in each case. As to the final destination of the securities the statistics have nothing to say. It is however well known that at least a part of the securities, especially mortgage bonds, which are taken by institutional investors of a private or public character are acquired only subject to special instructions which are given to the issuers as to the lending of the proceeds, whereupon the borrowers, who are apparently empowered and prepared to do so, make counter-payments of greater or lesser amount to the institutions acquiring the securities, as being the actual lenders. It may then be that these securities, which are virtually acquired at "grey" prices, in many cases do not remain in the hands of the first taker, but are sold to a subsequent taker at a greater or lesser discount as compared with the official Stock Exchange quotation, which is 98 per cent of par for 50/0 mortgage bonds. In this way it is possible that a part of the securities which, according to the statistics of placings, are taken by "public authorities" and "business enterprises", eventually find their way, although at "grey prices", into the hands of "private persons" (or even other "business enterprises"), whose proportion of the final security placings

<sup>1)</sup> Credit Institutions rendering returns for the monthly banking statistics, including institutions financing instalment buying, R.L.C., Finag, Postal Cheque Offices and Postal Savings Bank Offices. — 2) Including lendings to insurance companies and building and loan associations. — 3) Deposits at fixed period, or at notice, of at least one month. — 4) Set off against own bonds held by the banks. — 5) At notice, or fixed period, of 6 months and over. — 6) Not including increase due to re-valuation. — 7) Not including increase due to the credit granted to the Federal Government in respect of I.M.F. and I.B.R.D. — 6) Provisional figures. — 9) Adjusted for statistical alterations.

hence is in all probability greater than that shown in the sample statistics, amounting to only 6 per cent for February.

During February the borrowed funds and loans taken up by credit institutions in other ways from non-bank sources at medium and long term, including the so-called "transitory credits" which they take in their own names although passing on the funds for account of others, increased by only DM 180 million, which compares with an

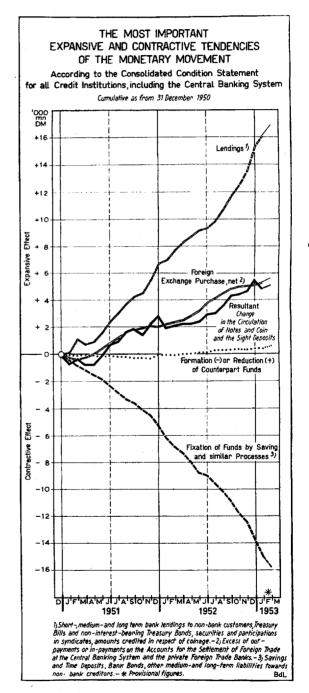

increase of DM 226 million in January, and one of DM 401 million on the monthly average of the fourth quarter of 1952, but only DM 169 million on the monthly average of the first quarter in that year. It brought up the absolute total of such borrowed funds to about DM 8,800 million. For the most part these monies come from "public authorities"; that is to say, they originate from public budgets and from Social Insurance Institutions. In addition

they include the loans which are channelled through the banking system out of Counterpart Funds for the purpose of effecting capital investments, as well as a certain amount of private loans. These latter consist in the main of loans in respect of which tax concessions can be claimed under Article 7 of the Income Tax Law or the corresponding provision in the Corporation Tax Law. Since these loans, for reasons of taxation, are granted especially towards the end of the calendar year, it is hardly likely that in February, unlike December, they accounted for very much of the funds which accrued to the banks. As regards, in addition, the considerable fall in the amount of the "monies borrowed and loans taken up" by the credit institutions from other sources during February, it is likely that this movement, similarly as the falling off in the banks' lendings at medium and long term, was mainly, if not entirely, due to seasonal influences.

If one takes the accruals of funds at medium and long term in the hands of credit institutions, as analysed in detail above, comprising the growth in savings deposits, the placings of bank bonds, and the increase in the amount of other funds at medium and long term originating from non-bank sources, and if one compares the resulting total with the growth in the volume of lendings and in the security holding of the banks, then one finds that in February, as has now been the case for some time past, the amount of the lendings only slightly exceeded the formation of savings capital during the same period. Further details in regard to this can be seen in the table above. According to this, the amount of the expansion of credit during the last few months would even be exceeded by the formation of monetary capital at the banks, if one included in this latter the increase in the time deposits. To do this however would of course be a doubtful proceeding; and indeed the whole process of setting against each other the increase in lendings and the formation of monetary capital for the purpose of ascertaining the "expansive effect" of the lendings is possible, on grounds of both statistics and fact, only subject to many reserves, which rule out the formation of hard and fast judgments on such a basis. Nevertheless it cannot be denied that the expansion of lendings is the less likely to bring about a growth in demand, the more it is offset by the abstaining from demand which results, at least for a time, from the formation of savings capital and from the fixing of money for given periods.

## The Volume of Money

Owing to the way in which large amounts of money have been converted into capital through brisk savings activity, while lendings have been only moderate in amount, the volume of money

recently increased at only a relatively slow rate, following an actual decrease in January. Details of the changes in the volume of money, and of the factors which determined these, can be seen from the graph on page 7 and the following table. As these show, the excesses of out-payments in connection with external payments and Clearings, or in other words the counterparts on the liabilities side to the additions to the gold and foreign exchange holdings and to the banking system's claims on foreign countries, continued to be the main elements in the expansion of the volume of money. Fundamentally of course a favourable balance of payments as a "money-creating factor" implies a certain damping down of trade and industry rather than a force tending strongly

to promote expansion in them, especially when, as has recently been the case, it is mainly based on a decline in imports. If one regards the last two years as a whole, then it is true that the surplus of the purchases of foreign exchange by the banking system over its foreign exchange sales is attributable not to any limitation of imports, but solely to the fact that the proceeds of the visible and invisible exports increased to a much greater extent than the payments due for goods delivered and services rendered by foreign countries, — a movement which of course cannot readily be expected to last.

Recently, among the elements making up the volume of money, the deposits of public authorities have further increased, having risen by DM

350 million in February, and by about DM 1,000 million between 15 December 1952 and 15 March this year; but the bank deposits of business and private customers have scarcely shown any rise, and in March, owing to the quarterly date for the payment of taxes, they probably even declined. The growth in the public deposits during February was mainly a result of the fact that the liquid resources of the Equalisation of Burdens Office rose further, details of this movement being given in the Chapter on Public Finances.

The total circulation of notes and coin declined until about the middle of February as compared with what it was in the previous month; but since then, owing to the onset of warmer weather and the way in which this made possible the resumption of work in outdoor callings, it has again been rising. On the daily average for the second half of February it was greater by DM 124 million, or 1.2 per cent, than in the second half of January; and on the same basis for the first half of March it was greater by DM 248 million, or 2.3 per cent, than in the first half of February, amounting on 15 March to DM 10,643 million. By way of comparison it may be mentioned that the pre-war index of seasonal movements in the circulation of notes and coin showed an increase of 1.1 per cent between January and February, and one of 2.4 per cent between February and March.

#### The Money Market and Bank Liquidity

On the money market until the second half of February the continuing seasonal decline in the note and coin circulation, coupled with the considerable surpluses of out-payments of DM in connection with foreign payments and Clearings, caused a predominance of the factors tending to produce liquidity; but in the last ten days of that month a certain change in the situation began to appear. It is true that the balance of payments remained favourable, and that the great territorial authorities such as the Federal Government and the Lands drew to some extent on their balances in the Central Banking System, so that Central Bank money consequently flowed in a steady stream into the banks which do not belong to that System. On the other hand however, as already mentioned, the circulation of notes and coin began to rise again; and in ad-

dition the cash resources of the Equalisation of Burdens authorities increased owing to the date for the payment of their levies in February, as well as to the fact that some initial difficulties over the out-payment of the Equalisation of Burdens monies have not yet been overcome. After the end of February, as usual, deposits came into the hands of the banks owing to the decline in the circulation of notes and coin. This however did not produce any greater liquidity on the market, because the banks were in the first place obliged to replenish their reserve balance at the Land Central Banks, on which they had drawn somewhat freely at the end of the month. From 10 March onwards, owing to the quarterly date for payment of the Assessed Income Tax and Corporation Tax, a further considerable tightening of the position of the banks and the money market became apparent; and this tightness was only slightly relaxed after the middle of the month. As from 3 March the Bank deutscher Länder, by way of conforming with the tighter market situation, raised its selling rates for Treasury Bills and six-months' non-interestbearing Treasury Bonds by 1/80/0, and those for Storage Agency bills and for twelve-months' non-interest-bearing Treasury Bonds by 1/40/0. Day-to-day loans also remained relatively dear, transactions in them taking place at Frankfurt (Main) about the middle of the month at around  $4^{0}/_{0}$ .

The factors determining the changes in the liquidity of the banks can be seen in detail in the following table. It is characteristic that the "net indebtedness" of the credit institutions towards the Central Banking System, that is to say, the difference between their indebtedness to the System and the giro balances which they keep there, after being reduced by 23 February to DM 502 million as against DM 1,062 million on 23 January, rose again to DM 1,087 million at the end of February; and at this level it fell short by only little of its total at the end of January. On 15 March this net indebtedness, at DM 1,017 million, actually exceeded by a substantial amount the total at the corresponding date a month earlier. In addition the excess reserves of credit institutions, which admittedly have always been small up till now, declined from DM 81 million in January to DM 59 million in February, which represented only 0.002 per cent of the liabilities carrying the reserve obligation. This was in spite of the fact that the reduction of the minimum reserve requirements, which came into effect on 1 February, reduced the required reserve slightly by about DM 65 million to a total of DM 2,120 million, although in the meantime the total deposits had further increased.

The most important Factors determining the Extent to which the Credit Institutions had to have Recourse to the Central Banking System

1) Including monies employed in Equalisation Claims; excluding Counterpart Accounts of the Federal Government. — 2) Counterpart Accounts of the Federal Government, including monies employed in Equalisation Claims, and E.R.P. Special Account of the Berlin Central Bank. — 3) Allied agencies, other deposits and items in course of settlement in the Central Banking System. — 4) Net balance of the following items: gold, credit balances in foreign currency (including credit balances with E.P.U.), foreign notes and coin, and foreign cheques; less liabilities towards E.P.U., DM credit balances of foreign banks, export letters of credit and, as from September 1952, Brazilian accounts in U.S. dollars.

At the moment it is impossible to forecast precisely the future course of the money market and of the liquidity of the banks. During the next few weeks the influx of gold and foreign exchange arising from transactions in goods and services may be further expected to constitute an important factor tending to produce liquidity. On the other hand however the seasonal growth in the amount of notes and coin required for trade will probably provide an appreciable counterweight to this, at least for the time being. In these circumstances the future extent of liquidity will largely depend on whether the public budgets, especially those of the Federal Government and the Equalisation of Burdens Office, are obliged to expend large amounts from the cash resources which they keep in the Central Banking System.

#### Stock Exchanges

For more than a year now the prices of shares have shown a declining tendency; and this tendency has also characterised the recent position on the Stock Exchanges. During February the average price of shares quoted on German Stock Exchanges, after elimination of the price changes due to the fact that some of the quotations were re-based on the shares issued in terms of DM, fell to 102.1, as compared with 104.95 in January 1953 and 138.38 in January 1952, this latter month having shown the highest share prices since the Currency Reform. The result has been that during the last fourteen months shares have on the average lost more than a quarter of their quoted value, the loss in the case of shares in manufacturing industries having been even appreciably greater than this, at 32 per cent, and that in the basic material industries somewhat smaller at 22 per cent. If one considers the absolute average of prices for shares in the basic material industries in particular, it should be remembered that the effect of the capital increases carried through by many companies is such that the values to be attached to the DM shares are much lower than might be supposed on the basis of the Stock Exchange quotations relating to the RM shares, or on that of the average prices which have been just mentioned and which are reproduced in the following table. In particular, the average price of shares in the basic material industries is in reality nothing like so high as it appears to the eye.

1) Source: Federal Statistical Office. Average price of 462 shares quoted on Stock Exchanges in the area of the German Federal Republic, in per cent of the nominal par value in RM. Out of these 462 shares, 107 have already, in January 1953, been transferred to the category where quotations are in DM. These include 76 shares of companies which have converted their capital in the 1:1 'ratio. The DM prices for the shares of companies which converted in a ratio other than 1:1 have been re-converted, for the purpose of calculating the average price in RM, into terms of RM on the basis of the conversion ratio.

This falling away in share prices cannot be immediately interpreted, as no doubt it could have been in earlier times, as representing an expression of opinion by the Stock Exchange about the future course of business. On the contrary, it is due in the first place to the fact that the material-value psychosis, which persisted until 1951, has since then been increasingly replaced by a spirit of calm consideration of earning power. To that extent, indeed, it constitutes evidence of growing confidence in the stability of value of the German currency. However, as considerations of earning power came to predominate, it was also inevitable that the deficient earning power represented by German shares, mainly owing to the double taxation of the earnings accruing to them as juridical persons, should by degrees become clearly reflected in the level of prices. As the average prices show, the share has in practice been put out of action as a means of raising funds for the bulk of the companies, and in particular for those in the basic material industries. The longer this state of affairs persists, the more serious are the consequences which it must entail for the future course of investment activity, and therefore, in the final analysis, for the maintenance of employment in the German economy.

There has on the other hand recently been some further improvement, even though this has been only slight, in the average prices of securities bearing fixed rates of interest, in so far as these were not issued after the Currency Reform, in which case they have nearly all been quoted hitherto at the price of issue. At least in the recent past it would seem likely that the improvement in prices has been a consequence of the First Law for the Encouragement of the Capital Market, even though that Law had been expected for a considerable time, so that its effects had been anticipated in the formation of prices. As compared with the lowest level which the prices for 40/0 bonds have touched since the Currency Reform, namely that at the middle of 1951, the

Feb. 1953	84.83	82.01	79.53

1) Up to June 1951 in terms of DM per RM 100 nominal value. As from July 1951 in per cent of the nominal value converted into DM in the ratio of 10:1.

average rise among mortgage bonds is about 15 points, or 20 per cent, while among communal bonds it is approximately 12 points, and in the case of industrial bonds, where however the lowest point was reached as early as March 1951, it is also 15 points. By way of contrast the Stock Exchange quotations for the fixed-interest-bearing securities issued since the Currency Reform, which, as already mentioned, in

almost all cases are the same as the price of issue, are on the whole purely fictitious. The reason is that only relatively few dealings take place at those prices, either because much the largest part of these newly issued securities is firmly held by institutional investors of a public character, or else because the securities are subject to arrangements providing for periods in which sales are forbidden for fiscal or contractual reasons, so that they cannot be offered on the Stock Exchanges. Consequently, owing to the smallness of the offerings, it is easy for the issuing institutions to support the Stock Exchange prices, should this really ever become necessary in the interest of defending the issue price. On the other hand there does exist a "grey" market, where the formation of prices is largely determined by the quotations for those securities in which dealings take place in spite of the period during which it has been agreed, under the contract, that they shall not take place. There the prices are appreciably below the price of issue; and in fact they have recently fallen somewhat further, although they have not descended again to anywhere near the level at which they stood before the discussions about the Capital Market Encouragement Law. The reason for the discount on these securities is largely that some of the borrowers are able to pay, not only the official rate of interest, but also the "capital procurement costs" which have already been mentioned, and which enable the credit intermediaries to re-sell at a discount the securities which they took up on behalf of their customers. Measures are at present being discussed with a view to removing these abuses, which are hindering the restoration of life to the capital market.

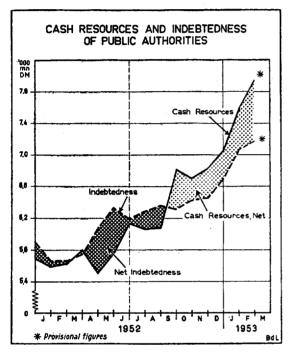

# Public Finances

During the last few weeks, according to the figures so far available, there has been only slight change in the cash position of the public budgets. The cash receipts continued on the whole to be larger than the cash expenditure even in February, which is usually a month of poor tax revenues, at least for the Federal Government and the Lands, both for seasonal reasons and because of the timing of the payments. In fact

the tax revenues of the Federal Government and Lands during February, at about DM 1,790 million, were a good deal smaller than in January, when they amounted to DM 2,410 million. However, at least in the case of the Federal Government, the expenditure was also less than in the preceding months; and therefore the deficits which those authorities would normally have had in February owing to the incidence of

the payments remained within comparatively small limits. At the same time there were actually large surpluses at the Equalisation of Burdens Fund and the municipalities and communes, the reason being that the quarterly payments in respect of the Equalisation of Burdens Levies and the Trade Earnings Tax¹) fell due in February. This would seem to have outweighed the relatively small cash deficits of the Federal Government and Lands. In March the position of those authorities has so far been clearly character-

<sup>1)</sup> In previous Reports the name of this tax (Gewerbesteuer) has been translated "Industrial Tax". The translation "Trade Earnings Tax" is now substituted because it describes more accurately the nature of the tax.

Note on the Graph

The public authorities are regarded as comprising: the territorial authorities, the special budgets of the Federal Government (that is, the Social Insurance Institutions, the Unemployment Insurance Fund, the Federal Railways and Federal Postal Administration), publicly owned undertakings (without own legal personality) and other bodies incorporated under public law, such as for instance the churches and charitable associations. The cash resources of these authorities shown in the graph above include: deposits in the banking system (that is, the Central Banking System and credit institutions), Equalisation Claims temporarily repurchased, and funds employed on the money market by the Central Banking System for certain budgetary authorities. The deposits at credit institutions also include funds which are no longer available in the budgetary sense, because they have been passed to banks for the purpose of financing capital investments, but have not yet been called into use by the recipients. So far as possible, debt liabilities existing between the various public authorities have been eliminated from the figures of indebtedness.

ised by the effect of the quarterly date for payment of the Assessed Income Tax and the Corporation Tax, and the resulting cash surpluses. At the time when this Report goes to press, however, it is not yet possible to express final judgment on the position in March, since the greater part of the cash expenditure is usually not effected until the last days of the month, and also because in March, as the last month in the financial year, it is necessary to expect an even larger rise than usual in the end-of-month expenditure—especially when, as is the case this year, there still remain some large balances of unused budgetary votes.

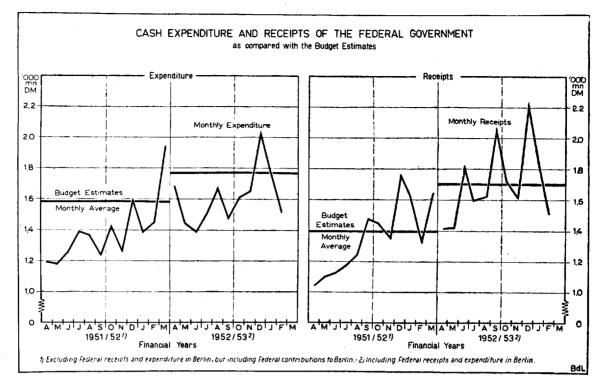

# The Federal Budget

During February the cash expenditure in the Federal budget was covered by the current cash receipts except for an amount of only DM 4 million. This is remarkable, inasmuch as the timing of tax payments always causes the receipts in the second month of every quarter to be comparatively small, so that they usually fall short of the expenditure. The receipts in February, at only DM 1,511 million, were even a good deal less than in November and August, the last two months with comparable tax payment dates, the reason being that in February the usual seasonal decline occurred in the proceeds of the Turnover Tax. At the same time however, also the expenditure was no more than DM 1,515 million, which was substantially less than in the preceding months, in spite of the fact that in February much the greatest part of the Government's contributions due in respect of Maintenance Assistance for the current financial year

<sup>1)</sup> The figures for 1951 exclude, and those for 1952 include, the Federal Government's receipts and expenditure in Berlin; but the 1951 figures include the Federal Government's contributions to Berlin. — 2) Months with comparable receipts.

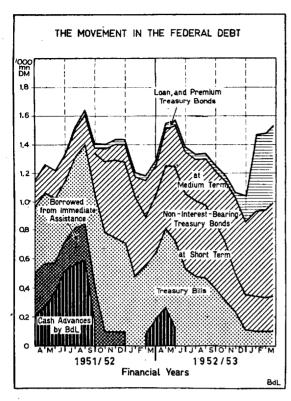

was paid. (These contributions arise from the Equalisation of Burdens Law, which was enacted in September 1952; the amount due for the year is about DM 79 million; and the amount paid in February was roughly DM 68 million.) Admittedly this decline in expenditure is likely to represent only a temporary break in the trend of spending, which is still upwards. In March, especially since this is the last month of the financial year, the amount spent must be expected to show a large increase as compared with February. According to the figures available for the three first weeks of March, it is true that the Federal expenditure would by no means seem to grow to the same extent as in March 1952 when, particularly owing to increased amounts having been called into use as occupation costs, the expenditure showed a steep rise already during the first half of the month. However, since the greater part of this expenditure will be effected only in the last week of the month, it remains to be seen what the monthly outcome will be and whether. as the result thereof, the cumulative cash surplus so far having accrued during the financial year, namely approximately DM 1,100 million up to the end of February 1953 (see the table above), will not after all be substantially reduced. A further point to remember is that in the "overlap"

period of the financial year, especially in April and May this year, a good deal of cash expenditure can still take place and be charged to the 1952/53 budget. The cash surplus so far accumulated therefore affords no ground for immediate conclusions as to the probable accounting result for 1952/53, although that result has already been considerably relieved by the fact that during April and May 1952 a part of the current cash expenditure was carried to the account of the 1951/52 financial year.

During the last few weeks, in spite of the relatively good cash position, the Federal debt<sup>1</sup>) again showed a certain increase. This was because advantage was taken of the good opportunities for the sale of non-interest-bearing Treasury Bonds, including those running for one year, to place further securities of this description. The result was that on 25 March this year the total Federal indebtedness amounted to DM 1,506 million. At this total it was greater by DM 35 million than at the end of January, and greater by DM 474 million than on 12 December 1952,

<sup>1)</sup> Only internal indebtedness newly incurred since the Currency Reform, and excluding Equalisation Claims and the interest-free loan granted by the Bank deutscher Länder to cover payment of the Federal Republic's subscriptions to the I.M.F. and the I.B.R.D., but including the non-interest-bearing Treasury Bonds to the amount of DM 105.4 million delivered to the Lands in respect of financial equalisation payments.

the date when the DM 500 million Federal loan was offered for subscription. Hence this Federal loan has scarcely led to any reduction of the money market indebtedness of the Federal Government, but, as matters now stand, has increased the cash reserves of the Federal Government by nearly its full equivalent. The effect of its issue, coupled with that of the non-interestbearing Treasury Bonds at medium term, has however been further to improve the structure of the Federal debt. Thus the ratio of the long-term debt to the total indebtedness, which was only 4 per cent before the issue of the Federal loan, rose by 25 March this year to about 36 per cent; and the amount of medium-term non-interestbearing Treasury Bonds rose from DM 153 million or about 13 per cent of the total indebtedness at the end of February 1952 to DM 643 million, or 43 per cent of the total, on 25 March 1953.

#### The Budgets of the Lands

As to the cash position of the budgets of the Lands, figures are available only for February (see the following table). According to these, in that month the budgets of the Lands showed only comparatively small deficits in spite of the fact that the receipts were smaller, both owing to the

timing of tax payments and for seasonal reasons. In March, as the result of the quarterly payments of Assessed Income Tax and Corporation Tax, it may be expected that there will again be a surplus, although the approaching end of the financial year will certainly also cause the expenditure to grow considerably.

For the purpose of meeting their expenditure requirements not covered by current receipts the Lands borrowed at short term during February to the extent of about DM 42 million. At the same time they drew some DM 15 million out of their resources kept at the Land Central Banks, or employed by these latter on the money market. However, February again reflected the improvement which has taken place in the cash position of the Lands during the past year. At the end of February 1953 their cash resources kept in the Central Banking System (see item 1 of the table) amounted to a total of about DM 565 million; and this, it is true, was lower by some DM 63 million than at the corresponding date a year ago, quite apart from the fact that it probably includes an amount, which cannot be precisely defined, of funds borrowed from the Federal Government, and also, as will be explained later,

from the Equalisation of Burdens Fund. On the other hand however the Lands presumably also had some share in the very large increase of nearly DM 1,200 million which took place in the deposits of public authorities at credit institutions outside the Central Banking System between February 1952 and February 1953, although accurate data on this point are unfortunately not available; and in addition the short-term indebtedness of the Lands has decreased by approximately DM 114 million as compared with what it was at the end of February 1952. It is true that during the past year the total indebtedness of the Lands, like that of the Federal Government, showed a further increase during the past year, the reason being that the Lands borrowed considerable amounts on the capital market to meet their investment expenditure, which is still rising. Bavaria for instance took a loan of about DM 200 million in May 1952, as will be remembered, and Hamburg one of approximately DM 25 million in December 1952, in each case thereby receiving long-term resources. Further loans of Lands are at present being offered for subscription, namely those of Hesse and the Rhineland-Palatinate; or it is expected that they will be offered during the next few weeks, as in the cases of Baden-Württemberg and Lower Saxony.

# Other Public Budgets

The delays in the use of Equalisation of Burdens monies1), due to the transition from the Immediate Assistance to the Equalisation of Burdens arrangements which took place on 1 September 1952, have been largely obviated during the last few months. Already during the three months from December 1952 to February 1953 the expenditure, at a total of about DM 575 million, was more than DM 220 million greater than in the first three months of operation of the Equalisation of Burdens arrangements; and in the first half of March the growth in expenditure continued at an increased rate. Between December 1952 and February 1953 however the surpluses, at roughly DM 145 million, were if anything somewhat larger than in the previous three-monthly period. This was due to the fact that the receipts of the Equalisation Fund, in

particular those from the levies on property, have been much better than was expected when the first "financial plan"2), for the period from 1 September 1952 to 31 March 1953, was drawn up. From December 1952 to February 1953 the total receipts, at around DM 720 million, were greater by nearly DM 235 million than in the previous three months, at least on the basis of the accounts. It is true that the cash position of the Equalisation of Burdens Fund did not improve in accordance with the surpluses achieved, the reason being that a part of the accounting receipts, namely the contributions made by the Lands towards the costs of Maintenance Assistance, have so far not been transferred, but only "made available" by the Lands. Accordingly, at the end of February the whole of the reserves of the Equalisation of Burdens Fund exceeded to some extent the total cash resources, amounting to about DM 650 million.

For the coming financial year 1953/54 the Federal Equalisation Office has now published a second "financial plan" in which the receipts and expenditure of the Equalisation of Burdens Fund are each estimated at roughly DM 3,085 million. Of this total about DM 2,555 million, or say an average of DM 213 million per month, consist of ordinary receipts, in particular those arising from the levies, from the Property Tax, and from the contributions by the Federal Government and the Lands; and the remaining balance of about DM 530 million is to be met by drawing on cash resources and by borrowing. In this connection the estimated drawings on cash resources are put at only DM 180 million, although, as mentioned above, the balances held by the Equalisation of Burdens Fund are at present much larger than that, although no longer quite so large as at the end of February. It is true that there is a prior charge on a part of the present cash resources in respect of those items of expenditure under the first "financial plan" which will be effected only in the course of the next few months, owing to the hesitant way in which the expenditure has been developing in the early stages. The total borrowings of DM 350 million for which provision is made during the coming year include the loan from the Equalisation of Burdens Bank at a figure of DM 200

<sup>1)</sup> See the Monthly Report of the Bank deutscher Länder for December 1952, page 16.

million. The original intention was to issue this loan as soon as possible. In the meantime however doubts have arisen as to whether the proceeds of it will be needed during the next few months. It is true that the estimates of expenditure have been raised in the "financial plan" for the forthcoming financial year to an average of around DM 257 million per month, as compared with only some DM 206 million under the first "financial plan". It can however be assumed on the basis of the experience to date that this increase in expenditure will take effect only gradually, especially since a good deal of expenditure under the first "financial plan" still has to be met. It will therefore be possible for the Equalisation of Burdens Fund to postpone the issue of the loan for a few months longer, without thereby prejudicing the rapid increase in the expenditure which is advocated by all concerned.

In the case of the municipalities and communes there was a further increase in tax revenues during the third quarter of the financial year, running from October to December 1952, mainly owing to the way in which the yield of the Trade Earnings Tax again rose. The total revenues in this period, at DM 1,142 million, were greater by some DM 100 million than the corresponding receipts in the previous quarter, and DM 156

million larger than those produced a year previously. To a large extent these additional receipts were absorbed by the rise in the expenditure on personnel, owing to the special payments made to officials and employees in December. At the same time it is true that during the period under report there was also an estimated increase of DM 35 million in the expenditure on

capital investments, bringing this up to a total of about DM 825 million. Over the same period there was however an even larger increase in the contributions for capital investment purposes from other public budgets, plus the long-term credits granted by banks to the municipalities

and communes; and hence the proportion which these authorities' own resources contributed towards the financing of their capital investments at least showed no further increase as compared with that in the second quarter of the financial year.

# Production, Sales and Employment

According to the overall index of the Federal Statistical Office, which includes building, the production of industry again showed some increase in February 1953. In January, on the basis of 1936 equals 100, this index stood at 140, as against a little over 167 in November, that having been the peak of last year's autumn and Christmas rise. As against this, the figure for February is provisionally stated as 142, although the changes as between the different groups composing it show great divergence, and in some cases are even opposite to each other. The rise in

the overall index, in so far as it exceeds what is usual in February at all, does so to only a small extent. In judging this rise moreover it is necessary to bear in mind that in some industries output in January was considerably reduced by the epidemic of influenza which prevailed at the beginning of this year; and that therefore, if

only for that reason, some recovery was due to take place in February. Last year in point of fact the usual winter fall in output continued even in February, contrary to the seasonal tendency.

# Great Increase in Building Activity

Among the industries in which production has risen since January to a considerable extent must be numbered building, if only for seasonal reasons. In February the index of building output, at nearly 89 per cent of its monthly average for 1936, was already higher by 7 per cent than it was in January this year or in February last year, in spite of the fact that the weather, at least in the first half of the month, still seriously hindered the resumption of outdoor work. This confirms the expectation, frequently expressed in previous Monthly Reports, that last winter's exceptionally large decline in building activity owing to the weather (the index of building output having fallen this year by about 50 per cent. as compared with 44 per cent in the winter of 1951/52, and 40 per cent in that of 1950/51) would lead to a compensatory reaction as soon as the spring weather set in. Indeed, the carryover of building from the 1953 building season is very large. For instance, according to the latest estimates the number of uncompleted dwellings is greater by some 5 to 10 per cent than it was a year ago. Much the same no doubt applies to the number of the building projects which have not yet been started. In addition however the current plans for building exceed in amount those of last year. For instance, in the period from November 1952 to January 1953 some 4 per cent more building licences for dwelling houses were granted than in the corresponding period of 1951/52; and, in spite of the fact that building costs now are lower, those estimated for all the overground buildings approved between November 1952 and January 1953 exceed the corresponding total for a year earlier by some 5 per cent. This, together with the fact that the loans promised by the institutional investors on house-building mortgages are already remarkably large in amount, while the growing

Amounts Promised, and Amounts Paid Out, by Institutional Investors on House Building Mortgages Monthly Position and Change as compared with the corresponding date a year previously

accumulation of capital also tends in other respects to assist the financing of building, gives ground for expecting that this year at least the building of dwelling houses will again proceed very briskly; and even that, as regards the number of dwellings produced, the total of some 440,000 for last year may possibly be surpassed. It is true that up till now the building of dwelling houses has accounted for only about one-third of the total building output. The remaining twothirds relate mainly to buildings for trade and industry and to public buildings, including what is known as "occupation building". Hence the extent of building activity this year will be decisively affected by whether the slightly falling tendency in the amount of building done for industry, which tendency may be expected to continue, will be offset or even outweighed by an increase in the building on public account.

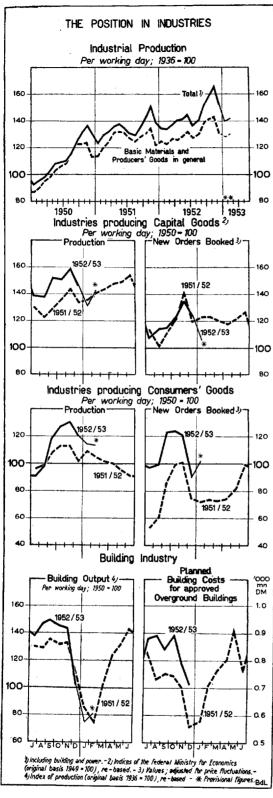

# Production of Capital Goods again higher

Besides the output in building, and on the whole even to a greater extent than this latter, the output of capital goods also rose during February according to the provisional figures of the Federal Statistical Office. The index of production for goods in this category, on the basis of 100 for the monthly average in 1936, went up to 167 in February as against about 157 in

January. Thus it again stands at a level somewhat higher than that in the corresponding month a year before, although in January, for the first time in its movement up till now, it fell short of that standard of comparison. However, if compared with its previous largely seasonal peak of 189 for last November, this index showed a fall in February amounting to as much as 12 per cent.

This renewed and quite considerable expansion in the output of capital goods in February seems at first sight to conflict in a certain degree with the fact that the amount of orders placed in the capital goods industries further declined between December and January, having fallen from 191 per cent of its monthly average level for 1949 to 163 per cent of that level; and that therefore the current movement in sales was offering little inducement to increase production. It should in this connection be remembered that the output of many industries was affected in January by chance factors which caused it to decline more than the sales position at that time would have rendered necessary. Hence the renewed increase in production need not necessarily be regarded as being in conflict with the movement in sales, just as it would be on general grounds a mistake to attach to minor and often fortuitous monthly fluctuations an importance which does not belong to them as indicators of the economic trend. In any case, a substantial rise in output between January and February, even in the capital goods industries, is quite in accordance with the usual seasonal movement. Taken as a whole, however, the total production of capital goods in January and February of this year has only now approximately regained the level which it reached in those two months of last year. On the other hand, the average of the two months is still some 11 per cent less than that for the fourth quarter of 1952, whereas in January and February of that year the production of capital goods was still maintaining a level approximately up to that of the preceding quarter.

So far as can be seen, the movement in the *individual* capital goods industries during recent weeks has again been relatively uniform. All the larger industries in the group had a share in the overall rise in output during February, just as all of them cut down their production in December

and January, although in varying degrees. In general, the present level of output still falls substantially short of that in November of last year, seasonal factors being in many cases mainly

responsible for this. The only industries which showed a relatively high output in February as compared with their seasonal peak of last year were steel construction and shipbuilding. This is due to the fact that in both these industries, but particularly in shipbuilding, there are still large amounts of unfilled orders, or at least, as in the case of steel construction, there were at the end of last year; and that in those industries, until last autumn, limits were set to the production by lack of steel, and in part also through the fact that the existing productive equipment was used to the full.

As already mentioned, in January, the last month for which figures are available at the time when this Report goes to press, the amount of new orders booked with the capital goods industries declined to 163 per cent of the 1949 level according to the quantity index calculated by the Federal Ministry for Economic Affairs for each working day. As compared with January 1952 this represents a decrease of 14 per cent, and as compared with the monthly average for the fourth quarter of 1952 one of 17 per cent. In forming a view on this reduction however one must not forget that for some time now there has been no further inducement to place orders at the earliest possible stage in the planning of investment projects, because even in the capital goods industries, now that a buyer's market is appearing, the periods for delivery have become shorter. To a certain extent therefore the decline in the amount of new orders placed as compared with the 1951 totals, and even in some cases those for the beginning of 1952, may perhaps be regarded as a simple consequence of the reestablishment of more nearly normal market conditions. Even the fact that since the spring of last year the index representing the quantity of new orders placed has in general been below the index of production calculated on the same basis (the ratio in January having been 163:186. or 88 per cent), affords no absolutely reliable basis for judging the present market position. This is because it is not known whether in 1949, the year which provides the basis for these indices, the amount of production and that of the new orders being placed were in a state of balance with each other. There can in any case be no

doubt that since about the middle of last year the position of the capital goods industries as regards sales has become notably worse, and that, according to what is stated by a number of industries, the decline in the amount of orders coming from abroad has recently been of special importance in this connection.

# Coal, Steel and other Basic Materials

During February the mining industry, as well as the production of basic materials and of producers' goods in general, were only partly represented in the rise which took place in the overall level of industrial output. It is true that there was a slight upward movement in the index of production in the basic material industries and in those turning out producers' goods; but there were a number of important exceptions to this. The chief exception was in the case of iron and steel production, which showed a decline in February. If reckoned per working day, the output of raw steel fell from 57,300 tons in January to 55,600 tons in February, while that of finished rolling mill products dropped from 38,600 to 36.300 tons. The main factor in these falls would seem to be the relatively poor state of the markets during the winter months. Since the summer of 1952 the amount of the new orders for rolled steel products has been smaller in almost every month than the deliveries. In February 1953 for instance the new orders reached 491,000 tons, as against deliveries of 772,000 tons and production of 871,000 tons. Many buyers are in fact counting on a fall in prices, and are therefore holding back with their orders. It would also appear that cancellations of orders have become more frequent of late. The result has been that the orders in hand at the end of February, at just under 4.1 million tons, were only equal to half of what they were at the middle of 1951. At the same time the amount of foreign orders on the books was smaller than at any other date since the end of 1949 or the beginning of 1950; and in addition the total new orders coming from abroad have considerably fallen as compared with earlier times. On the other hand, since the autumn of 1952 even the imports of rolled steel products, which were quite insignificant in the first half of the year, have owing to price conditions risen to such a point that they now exceed the greatly reduced exports of such products. Thus in February some 104,000 tons of finished rolled steel products were imported, as against 11,000 tons in February 1952; but only 75,000 tons were exported, as compared with 143,000 tons a year before. The difficulties over the

supply of steel, which lasted into the past year, have now been overcome, at least apart from some few exceptions, as for instance in the case of thick sheets. Indeed, for some time past this last of the great bottlenecks has been replaced by conditions in which, at least for the time being, the supply exceeds the demand. This of course in no way means that it is unnecessary to carry out substantial capital investments in the steel industry. The production hitherto achieved has been obtained only by exploiting the existing productive capacity to an extent which cannot be justified in the long run from the point of view of technical efficiency. As a result our productive equipment is now so defective by comparison with that in the important competing countries that Germany's power to compete will be seriously endangered unless there are extensive investments for the purpose of replacing capital assets, and providing new ones, in such a way as to overtake the other countries which have gained a start over Western Germany in this respect. In view of the fact that in the iron and steel industry, just as in the other basic material industries, the possibilities of financing capital investments out of producers' own resources remain in general seriously limited, it is evident that the carrying out of such investments must largely depend on the obtaining of the necessary capital from outside sources.

The last of the great industries in which production fell during February was coal mining. In that month the output of pit coal per working day was only 412,300 tons, as compared with 420,800 tons in January, 417,100 tons in December, and 440,500 tons in November, this latter having been the highest point reached by the output to date. The reduction was largely due to the influenza epidemic and to the Shrovetide carnival. It was in any case entirely attributable to a considerable amount of absenteeism, since there were increases in the number of men employed, including those employed underground, as well as in the output per man-shift. It should however be remarked that among the workers engaged for the first time in January and February there were 4,000 refugees from the Soviet zone of occupation. Thanks to the larger number of men employed and to the greater output per man-shift, the total output at once rose again as soon as the number of influenza cases fell off and the carnival season came to an end. In the second week of March the output had already risen again to 423,000 tons per working day, as against only 406,000 tons in the third week of February.

It is in general scarcely possible any longer to speak of any coal shortage, although so far there have been no signs of difficulty over sales of coal. Indeed, the supply of coke still continues to be a little tight, this being not the least of the reasons why a further 372,000 tons of coal were still imported from the United States in February, against as much as 1,075,000 tons in February of last year. It is probable that it will not be possible to do entirely without these imports of coal in the near future, although it may perhaps prove feasible to replace them to some extent by purchases from Great Britain. The point is that any further increase in output, even apart from the adverse seasonal factors during the next few months, will in particular be rendered difficult by the fact that as from 1 April 1953

the number of hours worked in shifts each week will be reduced to 45. It is true that in the immediate future the demand may also not be very large, especially since the stocks of pit coal, pit coal briquettes and lignite briquettes in consumers' hands are at present relatively large, amounting at the end of January to 4.8 million tons among the principal categories of takers, as compared with not quite 3.5 million tons a year before.

#### Activity in Consumers' Goods

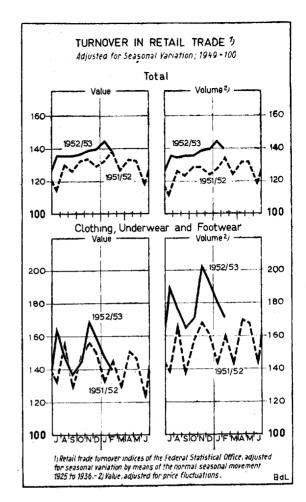

According to the index of the Federal Statistical Office the total output of consumers' goods again showed a slight decline in February. The fall however amounted to no more than 1 per cent, since the index, as provisionally calculated, dropped only from 144 to 143. The decline was mainly due to the fact that in February, owing to the long continuance of the strike of textile workers, the output of textiles was about 4 per cent less than in January. On the other hand the production of leather goods, and in particular of footwear, already showed some increase in February; the output of hollow glassware continued the upward movement which began in January; and in the case of pottery, to limit the matter to these major industries only, the January level of production was maintained. As compared with the position a year ago, the index of output of consumers' goods in February actually still shows a rise of 12 per cent. The sales prospects in these industries must still be described as relatively good, so that production will continue to receive support from this factor, and even perhaps further stimulation. The quantity index for new orders placed rose again in January, the last month for which figures are available, reaching a level some 40 per cent higher than in January 1952. The reason for this is no doubt that this season, owing to the Christmas trade, stocks have been largely cleared, and therefore traders were obliged promptly to place considerable orders again, whereas at this time a year ago they were limiting their orders to the minimum. True, the position was not uniform as between the individual industries. In those producing leather and footwear the orders placed in January showed a further fall. In addition, there are certain industries in which the amount of new orders booked

has for some months been lower than the production. However, this permits conclusions as to the future course of economic activity only subject to very great reserves, because no data are available as to the absolute level of the orders placed, and the output, in the year which serves as basis. Finally, the turnover in retail trade has been in some cases disappointing, at least in February. Whereas the contraction in retail sales during January was quite within the usual seasonal limits, the further fall in February exceeded that in January by about 10 per cent in terms of quantity. The fall in turnover was

relatively large in the clothing trade in particular. In terms of volume however the sales in all cases still exceeded those in the corresponding month a year ago; and, interestingly enough, they did so especially in the clothing trade, although February this year contained one sales day less than February 1952. It must further be remembered that the sales in February of this year may have been prejudiced by the continuance of cold and wet weather, because this would have the effect of temporarily delaying the spring buying. It would certainly seem that in March, according to reports from individual trades, the sales position improved in those which are largely dependent on seasonal factors. If there were a further increase in retail sales of more than

seasonal extent, this would actually be quite in accordance with the movement in the incomes of the masses. At present these are continuously rising, not only owing to the quite large growth in employment in outdoor callings, which is at present again proceeding, but also because of the continuance of wage and salary increases, as well as because of the rise in the payments on account of public pensions and other benefits - in particular owing to the raising of the basic payments made by the Pension Insurance Funds, together with the growing distributions from the Equalisation of Burdens Fund. As from 1 April 1953 for instance, instead of the non-recurrent assistance payments which were made last year, there will be a further rise of 20 per cent applied to the (original) basic salaries or wages of persons in the public service. The effect of this last measure will no doubt be to increase by about DM 400 million as compared with the previous year the expenditure on personnel in the public

1) These payments, including those due at an earlier date, were begun in February 1953. — 2) Estimated on the basis of expenditure to date, and of the planned amounts for 1953/54. — 3) Estimate by the Federal Finance Minister for the 1953/54 budget. If the present stream of about 40,000 refugees per month continues, substantially higher expenditure of say DM 900 million must be expected. — 4) The additional expenditure compared with that of the previous year is given net as from 1 April 1953, that is, less recoveries through the Wages Tax. The amount for the previous year allows for the special allocations then made, only part of which was taxed. — 5) On the assumption that the lowering of the tax will become effective on 1 May 1953. If this is delayed, the amount stated for 1953 will be reduced by about DM 95 million per month.

budgets (less recoveries under the head of the Wages Tax), even after allowance is made for the non-recurring assistance payments which were made that year. There is the further point that in the near future some reduction of the Income Tax may be expected, even though it is possible that, owing to the length of the discussions in Parliament about the detailed arrangements for the reduction, this may not come into effect on 1 May, as was originally intended, but only at a later date. In the sphere of retail trade the prospective relief to consumers under the head of taxation is already being anticipated by the granting of a certain amount of consumers' credit; and indeed it is in general true that the substantial growth in the facilities for financing sales are reinforcing the effect of the rise in incomes, especially the effect on the sales of higher-grade and luxury goods.

#### Labour Market

As already mentioned, there has been a considerable decline during the last few weeks in the number of the unemployed. In the first half of February, owing to the bad weather then, the total increased by almost a further 80,000. The result was that at the middle of the month it stood at about 1.9 million, and thus slightly exceeded the highest level reached last winter, which was 1.89 million at the middle and end of February 1952. In the second half of February this year however the figure fell by 91,500, and in the first half of March by as much as 275,000. The result was that the total at the middle of March, namely 1.54 million, was already 184,000 below the level at the corresponding date a year before. Consequently the seasonal increase of 874,000 in the number of the unemployed between the end of October and the middle of February has been worked off to the extent of more than 40 per cent within a single month. This large reduction is to a great extent due to the

fact that this winter the purely seasonal unemployment was especially high, not only because the weather interrupted outdoor work more than usual, but also because the ratio between the number of those employed in the so-called outdoor callings to the total of those employed had again risen as compared with what it was a year previously. This was especially because, unlike what occurred during the first few years after the Currency Reform, there has been virtually no structural exodus of labour from the farms since 1951. At all events at the end of January this year, while the total number of the unemployed at 1.82 million was almost the same as a year before, this figure comprised 664,000 in outdoor callings as compared with only 600,000 at the end of January 1952.

It now seems safe to expect a further growth in building activity, and progress in the spring work on the farms. Hence there is every prospect that the number of the unemployed will continue rapidly to fall, even if employment in industry should grow only slowly. It is true that a quite large addition to the number of new applicants for work must also be expected in the near future,

especially owing to the fact that young people will be finally leaving school at Easter. The number so leaving is put at about 630,000 in 1953, as compared with 596,000 last year. In so far as they report to the labour exchanges, and find no vacancy as an apprentice or worker, they will under the existing regulations be recorded as unemployed, even though they have never yet done any work. Indeed, the German unemployment statistics cover many people who in other countries are not simply counted as unemployed. In addition, it still remains necessary to expect, for a time, a larger influx of refugees from the Soviet zone of occupation. In January and February alone the number of the applicants for work who had fled from the Soviet Zone amounted to some 12,800, although some of the refugees naturally do not apply for work until a certain period of transition has passed, and although many of those who have left the Soviet Zone during the last few months are still awaiting transport from Berlin, which is generally their first place of refuge. It is therefore to be hoped that the increase in the amount of productive assistance to refugees, which is now contemplated, will speedily be made a reality.

# Prices

During the last few weeks the level of prices has been subject even more clearly than before to downward tendencies. The main incidence of these continued to fall on goods near the stage of consumption, in the case of both industrial and farm products, although as yet it is hardly possible to say that there is any decline, for reasons due to the underlying economic trend, in the sales of consumers' goods. Hence there is no doubt that the cause of the downward pressure on prices lies in the continuing enlargement of potential supplies, which has led to a notable heightening of competition, with corresponding concessions on the prices demanded. Consumers have derived all the more benefit from this process, because recently the resulting effects on the cost of living have scarcely been offset any longer by the direct or indirect consequences of the ordering by the authorities of higher prices, rents or wage tariffs, as they frequently were during past months. Hence in February, for the first time in a considerable period, the downward pressure on market prices was almost fully reflected in the general indices for retail prices and the cost of living. Thus the retail price index, which had remained virtually unchanged from July 1952 to January 1951, fell during February by about a point, namely from 106 to 105 per cent of its level during the first half of 1951 the main factor in this movement, apart from the drop in the prices of various foodstuffs, having been price reductions applying to textiles, furniture, paper products, toys, and also certain articles of hardware used in the household. Similarly the cost of living index fell for the first time since its slight renewed rise of last summer, declining to 109 per cent of its level in the first half of 1950, as against 112 per cent in the fourth quarter of 1951: this last was the peak of the rise caused by the Korean boom, which in-

Re-calculated on the basis of the Federal Statistical Office's original figures. — <sup>2</sup>) Basic materials of West German and foreign origin. — <sup>3</sup>) Only basic materials produced in Western Germany. — <sup>4</sup>) Newly calculated; seasonal fluctuations eliminated. — <sup>5</sup>) Provisional figures.

cidentally reached precisely the same level as the height of the post-Currency Reform rise in October to December 1948. In point of fact the decline in food costs was the decisive element in the decline of the cost of living in February; the remaining sub-groups in this index showed no further change as compared with the previous month — not even that for clothing, which, it is true, had fallen by January to a point some 8 per cent below its level at the corresponding date a year before.

The producers' prices of industrial products also show that up till now it is in general only the prices of consumers' goods which have succumbed to the downward pressure resulting from the general market situation. Thus, the group comprising the prices of consumers' goods was the only one of the main groups making up the general index of producers' prices of industrial products to show a fall in February. By way of contrast, the group-index for capital goods remained stable, while that for the prices of basic materials actually showed a slight rise as compared with January.

The fact that the prices of capital goods have on the whole been hitherto well maintained is particularly remarkable in view of the hindrances to activity in those goods which were described in the last Chapter. From this one may conclude that up till now there has been no actual sales crisis affecting these goods. It is true that in the capital goods industries in particular, until very recently, costs have been rising as the result not only of wage increases, but also of the higher prices for certain basic materials; and hence, if the market situation had been better, the prices of capital goods would in many cases no doubt have been raised. Hence in their case the very

fact that prices have been kept stable is an indication that sales in many directions have become worse. There is the further fact that here and there prices have actually begun to fall away, even though this is as yet hardly reflected in the group-index, at least up to February. The most typical expression of this movement has been the reduction of the prices for motor vehicles, which reduction will in part apply only in March, the occasion for it being the International Automobile Exhibition. There are however also other capital goods industries in which there are growing signs that the market position will make some lowering of prices unavoidable. This follows on more than a year during which various increases in costs prevented the gradual disappearance of the backlog of orders accumulated during the Korean boom from resulting in more than a relative stabilisation of the price level.

As already mentioned, there was a slight rise during February in the index of domestic prices of basic materials. However, the decisive factor in this movement was simply the further 10 per cent rise in the price of pit coal, which continues to be controlled as before. This increase was chiefly intended as preparation for the "common market" of the countries in the European Coal and Steel Community, among which the German Federal Republic had relatively low pit coal prices. To judge by the list of maximum coal prices which was published at the middle of March by the European Coal and Steel Community, no further general changes in coal prices need be expected for the present; but some modification will be required in the special prices which have so far applied to certain preferred groups of consumers. Thus, as from 1 April the special prices for sea-shipping and for power producers will be abolished; and the price reductions which are at present in force for the Federal Railways and for inland shipping will be made smaller. As regards inland shipping, even these limited concessions will remain in force only on condition that they shall in future be granted to all the Rhine shipping companies without regard to their nationality. In addition, the German coal mines will in future have to bear the costs entailed in cheapening the coal imported from the other countries belonging to the Community, in so far as such coal is bought by groups of consumers enjoying preferential treatment. On the other hand, the special prices which apply to coal for domestic consumption and for deep-sea fisheries will remain in force unchanged.

Apart however from this fresh rise in the price of coal, the level of basic material prices in Western Germany has fallen rather than risen during recent weeks. Specially noteworthy in this connection is the movement in rod steel prices, which were released from control at the end of January, and soon afterwards showed a slight decline, no doubt largely owing to the pressure of the cheaper material imported from Belgium and France. The opening of the "common steel market" has been postponed until 1 May 1953 because great difficulties arose over the fixing of the prices, owing to the different charges on the industries by indirect taxes in the various countries. Once that market is established, the possibility of such under-bidding as that just described should be largely removed, because then the tax concessions, which have so far been enjoyed in particular by the French steel exporters, are to disappear. It is of course possible that even then the general market situation may still exert a certain downward pressure on steel prices, if the activity in capital investment does not in the meantime increase.

As regards some of the remaining price declines among basic materials, influences arising from the world market have been of a certain importance, at least up to February. This applies for instance to cotton prices, which in February were again noticeably weak in harmony with the movement on the world markets. Now, under the influence of this decline, the prices for flax yarn and hemp in Western Germany have also fallen. There has moreover been a continuance of the downward movement in the domestic prices of roundwood and sawn timber, there being in their case also a certain connection with the movement in world market prices.

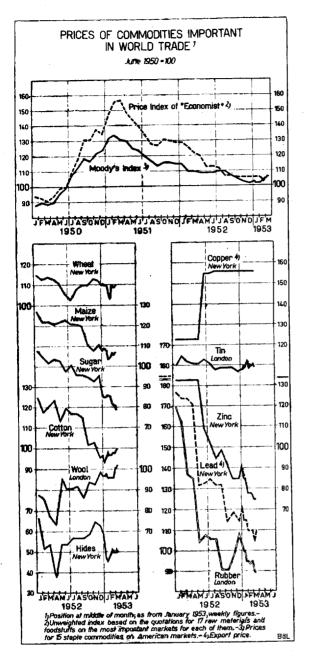

However, it can no longer be said that there has of late been any persistence of the general weakness in the international raw material markets, with corresponding repercussions on prices in the German Federal Republic. On the contrary, under the influence of special factors, some of which will no doubt be only temporary,

such as the removal of price controls hitherto existing in the United States, coupled with the usual spring revival in activity on various markets, prices on the international markets for raw materials since the middle of February have in many cases been very firm. The chief statistical expression of this is the fact that since the middle of February the most important international price indices for raw materials have at least shown no further fall, but in every case have risen to a greater or lesser extent. For instance, on the basis of 18 September 1931 equals 100, Reuter's index of British raw material prices rose from 509 in the second week of January to 512 in the second week of March; and Moody's index of staple commodity prices on American markets stood on 16 March at 424, as against 406 on the average of the first and second weeks in February. The particularly large rise in this last index is

however mainly due to the repeal, as already mentioned, of the regulations as to maximum prices for copper, steel scrap, crude oil, coffee and certain other commodities in the United States, so that the rise probably reflects only to a certain extent the real market tendency. However that may be, there has been during the last few weeks an unmistakable predominance of the tendency for prices to rise. Of the more important raw materials on the main international markets, those which were until recently showing the most marked inclination to fall were copper, rubber and zinc. On the other hand certain commodities. the markets for which were until then in some cases under quite strong downward pressure, as in the case of cotton, cocoa, some oilseeds, fats and maize, have recently been rising in price in a greater or lesser degree. In addition the upward movement in wool, which was to some extent

interrupted in February, continued during March; and American prices for wheat have recently become somewhat firmer. It would seem that, apart from seasonal influences, the recovery in the American prices for cotton and wheat was in the main started by the expectation that larger allocations of dollars to certain countries by the M.S.A. will cause some increase in exports. Actually however there is still a substantial excess supply of both wheat and cotton in the United States, the more so since the last crops of these

two products were relatively large, while the exports from the United States have been rendered even worse, during the crop-year to date, by the competition of other countries than would have been natural in view of the course of demand as a whole on the world markets. The only reason why the resulting downward pressure is not reflected in the prices is that the possibilities of obtaining loans, which exist under the programme of measures for the support of farm prices in the United States, a programme that is in force until the end of 1954, are preventing the formation of genuine market prices. Similarly the maintenance of the excessively high pegged price for United States wheat is constituting the chief difficulty in the way of extending the duration of the International Wheat Agreement, about which negotiations are at present taking place in Washington. The importing countries originally requested that the I.W.A. price of 180 cents per bushel for United States wheat, which was hitherto applied, should be kept in force. This would entail the payment of further considerable subsidies by the U.S. Government to the American farmers, if the price level which has been conceded to them is to be maintained. It does seem however that there is a prospect of agreement on a middle price basis.

As to the future course of international raw material prices, it is of course hardly possible to draw any conclusions from the greater firmness of prices during the last few weeks. It may be that, as was indicated above, this movement will be quite temporary. True, there is every prospect that in the immediate future the course of prices on the international raw material markets will show greater differentiation, in accordance with the special considerations affecting supply and demand: see in this connection what was written in the Monthly Report for January, on page 39 and following pages. However, any new general upward movement will be possible only if there is a very large growth in demand; and this is hardly to be expected in the countries which are of decisive importance for the world's economy, even if the state of business should remain satisfactory, unless there should be a renewal of covering purchases on a considerable scale for political reasons.

# Foreign Trade and Payments

The formation of a view as to the external trade of the German Federal Republic and West Berlin is still rendered somewhat difficult by the fact that, especially for the months of December and January, the foreign trade figures still reflect more or less inaccurately the actual imports and exports of those months owing to statistical reasons. Hence a comparison of the February figures with those of the preceding months, just as hitherto, still permits no precise judgment as to what is in fact occurring. It does however seem clear that the total foreign trade in February has if anything become somewhat less, especially in terms of value, and that the imports have declined more than the exports. The result was that the balance of trade, unlike that for January and that for the whole fourth quarter of 1952, once again showed a surplus.

#### Imports and Exports

In terms of absolute value the *exports* in February amounted to DM 1,228 million, at which level they were about 3 per cent lower than in January. In this connection it must be remember-

ed that for most purposes February contained two working days fewer than January, so that the average exports per working day showed a slight rise rather than a further decline. Since however the exports in January, perhaps partly

from statistical causes, were already relatively small, this affords only poor consolation. As matters stand, it must on the whole be assumed that the results for February also indicate some fall in exports, at least for the time being. In any case the exports in February were again smaller than in that month a year before: this follows on January, when for the first time since the war the total not only did not exceed that of the corresponding month a year earlier, but did not even reach it. The result is that the average monthly value of exports for the first two months of the year is only about DM 1,250 million, as against an average of DM 1,290 million for January and February 1952, and one of over DM 1,400 million for the whole of last year.

Some indication of the reason for this decrease may be found in the regional breakdown of exports, as shown by the following graph and by the table on page 31. From these is clear

that one of the causes determining the contraction of exports is to be found in the difficulties which have arisen over trade with a large proportion of the bilateral offset account countries, owing to the fact that in many cases the limits of the "swings" for payments to Germany have been reached and exceeded in the course of the past year. Thus Germany's exports

to the so-called "other offset account countries" reached a monthly average in January and February this year of only DM 163 million, as against monthly averages of DM 197 million, DM 237 million and DM 235 million in the first, second and third quarters of 1952 respectively.

In addition however the exports to E.P.U. countries, which were still slightly increasing until the end of 1952 in spite of the partial import restrictions in Great Britain and France, showed a not inconsiderable fall in January and February; and in consequence their average for those two months, at DM 922 million, fell short by no less than DM 94 million of the monthly average for the first quarter of 1952, and by DM 196 million of that for the fourth quarter, which however was relatively high for seasonal reasons.

been appearing in the capital investment activities of other E.P.U. countries for some time past, just as clearly as in those of the German Federal Republic, have caused a certain contraction in our exports of capital goods, which are particularly important as an element in German exports as a whole. Finally one must not ignore the fact that during the past year the competitive position of German exporting industries has become somewhat worse, rather than shown further improvement, the reason being that in some cases their costs have risen more than those of other countries, while the periods required for delivery by many of their competitors have been greatly reduced.

On the other hand the level of exports to the Dollar Area continues to be relatively good. The

1) The areas are classified for imports according to the countries where the goods were bought, and for exports according to the countries buying the goods. — 2) Total imports, including imports financed by foreign aid.

The reasons for this shortfall are hard to define. The import restrictions in Great Britain and France, which have already been mentioned, played some part in it, although certainly not the decisive part; for, as has been already pointed out in an earlier Monthly Report, these restrictions affect only a part of the German exports to the countries concerned, and the declines in the exports in those categories were to a large extent made good, at least until towards the end of 1952, through the expansion in the unrestricted exports. It is certainly possible that the signs of an overdone position which have

monthly average of exports to the countries in that area during the fourth quarter of 1952 was DM 176 million, which was greater by about DM 65 million than the average for the fourth quarter of 1951. Even in January and February of 1953 the monthly average was DM 158 million, which still exceeded the corresponding figure for the first quarter of 1952 by some DM 52 million, although the figures do show a certain decline as compared with the fourth quarter of 1952 — which decline may however be due only to seasonal, or perhaps only to statistical causes. This comparatively gratifying development of

Western Germany's dollar exports is the more remarkable, inasmuch as it is based on increasing sales of finally finished goods; on the other hand the exports to the Dollar Area of finished products of rolling mills and other finished products of the ironworking industry, which constituted 27 per cent of the total exports to that area in 1951 because at that time they were linked with the exports of coal from the United States, had fallen by the fourth quarter of 1952 to just under 10 per cent. Thus the relief which Western Germany has gained in the matter of dollar payments since the spring of last year is at least partly the result of growing exports of goods; it has not been due solely to the larger earnings from services, to the decrease in imports from the Dollar Area, and to the various special factors which have been repeatedly mentioned in past Monthly Reports.

In February, according to the foreign trade statistics, the imports of the German Federal Republic and West Berlin amounted to only DM 1,177 million, at which total they were in either case some 13 per cent less than both those in January and the average for the year 1952. As compared with the total for February 1952 the absolute decrease was no less than DM 284 million. Even if one makes allowance for the fact that during the last few months the statistical allocation of import returns to individual months may not always have been quite accurate, these reductions are noticeably large. In so far as they represent a decrease as compared with the figures of last year, the reason is no doubt to be found solely in the fall which was until recently taking place in the world market prices for raw materials and foodstuffs, which naturally benefited in special degree the German Federal Republic, as a country which mainly imports goods of those natures. In point of fact the overall volume of imports in January and February this year was about 6 percent greater than in the corresponding period of last year, whereas the value of imports on the other hand fell short by about 12 per cent of its level at that time. The average value of the import-unit has in fact fallen by about 17 per cent as between the beginning of 1952 and the beginning of 1953; and, even though this drop may be partly due to shifts in the structure of imports as between the different categories

of goods, there can be no doubt that its most important cause was the fall in prices on the international markets for raw materials and foodstuffs.

In February the imports resulting from allocations by the Mutual Security Agency (M.S.A.) were only insignificant in amount. At a total of not quite DM 16 million they reached their lowest level to date. As against this, the monthly average value of goods which arrived during 1952 in respect of M.S.A. assistance was about DM 40 million, while the monthly average for the second half of the year alone was something over DM 48 million. Since July 1952 M.S.A. imports have in the main been based only on allocations carried over from earlier Marshall Plan or M.S.A. years, the reason being that so far in the current M.S.A. year there have been allocated only \$ 22 million1), the countervalue of which is intended solely for West Berlin. In the meantime most of the amounts carried over from earlier years have however been used up. Those still remaining on 28 February 1953 amounted to only some \$ 20 million, or DM 84 million; and hence the M.S.A. imports would within a short time completely cease to flow, if no further allocations were made by the M.S.A. It is however to be expected that the M.S.A. will in fact make further funds available, at least for West Berlin. The allocation of \$ 22 million which was made for this purpose in December 1952, as mentioned above, is to be regarded as a first instalment of such provision. With the inclusion of this amount the M.S.A. funds still available are equal to \$ 42 million, so that certain further M.S.A. imports may be expected to accrue in the immediate future.

Owing to the large decline in imports, the balance of trade in February again showed a surplus, amounting to about DM 51 million. This followed on the adverse balance for January, which amounted to nearly DM 91 million on the foreign trade as a whole, including imports in respect of M.S.A. assistance, and on that of not quite DM 21 million for the fourth quarter of 1952 — although, for the reasons which have been already stated, it is doubtful whether the allocation of these deficits to the individual months in the period in question is entirely cor-

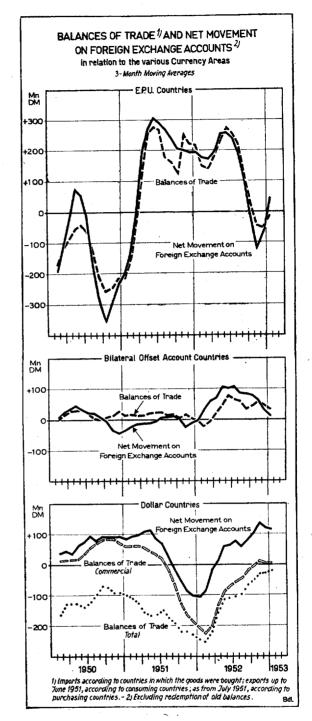

<sup>1)</sup> Excluding an amount of \$ 1.7 million originating from an earlier GARIOA allocation.

rect. If the imports financed out of M.S.A. resources are eliminated, the exports surplus for February rises to DM 67 million; the import surplus for January, as mentioned above, is reduced to just under DM 70 million; and that of not quite DM 21 million for the fourth quarter of 1952 becomes an export surplus of about DM 109 million. The movement of the balances arising from transactions with the various currency areas can be seen from the above table.

# The Balance of Payments

In February, with the help of the renewed improvement in the balance of trade, the surpluses on the balance of payments showed further growth. In relation to all currency areas together there was a favourable balance of about \$ 64 million, as against one of about \$ 45 million in January, and about \$ 23 million on the monthly average of the last quarter of 1952. Thus, it is true, there has been nothing like a recurrence of the large surpluses achieved in the third quarter of 1952, and still less of those achieved in the second quarter, representing monthly averages of around \$ 80 million and \$ 95 million respectively.

There was in particular during February a further increase in the surplus arising from transactions with the E.P.U. countries. If the accounts not comprised in the official clearing are included, this surplus amounted to \$ 35.3 million, as against \$ 23.4 million in January; and it contrasts with the result for the fourth quarter of 1952, when it will be remembered that there was a deficit of \$ 76 million, mainly owing to the fact that the Bank of England for a short time during the autumn permitted purchases of goods from the Dollar Area against settlement in sterling. Throughout the period the payments arising from this last cause occurred at dates before the corresponding movements of goods, because the payments for those purchases had to be made within relatively short periods, whereas the actual imports took place at rather later dates. This also explains the discrepancy which was until very recently apparent as between the dates of changes in the net balances on the foreign exchange accounts and those in the balances of trade on transactions with the E.P.U. Area. Thus, as against the net deficit of \$ 76

million, which as already mentioned occurred on the foreign exchange accounts during the fourth quarter of 1952, there was an adverse balance of trade amounting to only \$ 28 million; but on the other hand in January and February the balance of payments showed a surplus of nearly \$ 60 million, although the balance of trade in those two months was adverse to the extent of about \$ 1 million. It is true that during the period last mentioned the discrepancy relates mainly to January, while it has lessened in February, a fact which indicates that the major part of last autumn's imports of dollar goods against sterling are now coming to an end, even as regards their effect on the trade figures.

After the net favourable movement in February of \$ 31.6 million on the accounts comprised in the settlement, and that of \$ 35.3 million on all the foreign exchange accounts with E.P.U. countries, the cumulative accounting position of the German Federal Republic in relation to the E.P.U. rose to about \$ 430 million.

1) Change in accounts of the Bank deutscher Länder and the Foreign Trade Banks, not taken into account in the E.P.U. settlement. — 2) Position at end of each period indicated.

In accordance with the method of settlement employed in the upper tranches of the creditor quota, \$ 15.8 million of the increment as compared with the position at the end of January were carried to account as a credit granted by the German Federal Republic to the E.P.U., while \$ 15.8 million were paid to the German Federal Republic. Thus, out of the German Federal Republic's total cumulative surplus to date, \$ 265 million have been settled by the granting of credit, while \$ 165 million have been paid in gold or dollars. On the transactions during March so far the German Federal Republic has also had a favourable balance with the

E.P.U. On the accounts forming the basis of the central settlement the surplus up to 20 March was roughly of the same order of magnitude as in the corresponding period of the previous month. In March however our accounting position in relation to the E.P.U. will show further improvement to nothing like the same extent as it did in the last two months. During the third ten-day period in March, immediately after the ratification by the German and Israel legislatures of the Hague Agreement with Israel, the German Federal Republic made sterling payments, as provided in that Agreement, in respect of certain deliveries of oil from the Sterling Area to Israel - whereas all the other deliveries to be effected by the German Federal Republic under that Agreement are to take the form of direct deliveries of goods from Western Germany itself. As the result of these payments, the German account with the E.P.U. in March will have to bear a substantial additional burden. There is the further point that on 1 April this year the first payments fall due under the agreements reached with Switzerland regarding what is known as the "clearing milliard"; and these will have to be transferred as a charge on the March results. Hence in all probability the E.P.U. settlement for March will embody the first appearance of the additional burdens which the German Federal Republic will in future have to bear as the result of the debts arrangement recently reached, as well as of other fresh obligations towards foreign countries.

On the transactions with bilateral offset account countries there was again a surplus in February; this contrasts with January, when the German Federal Republic had an adverse balance with those countries, although quite a small one. However, the February surplus of altogether \$ 3 million was nothing like so great as the large surpluses which were being earned with those countries more particularly in the summer of last year, and to a somewhat smaller extent even until last November — although, as will be remembered, this led to the agreed limits of the "swings" being fully used or exceeded by the countries concerned. To go into detail, the net favourable movement on the accounts during February was mainly due to the continuing improvement in our payments position in relation to Argentina. Up to the end of 1951 there was a deficit of \$ 33 million in relation to that country. By the end of January 1953 however this had been reduced to \$ 3.6 million; and in February, for the first time in a considerable period, it was replaced by a small surplus, amounting to \$ 0.7 million. Since it is probable that the outstanding export contracts made with Argentine buyers now substantially exceed the contracts made by German importers, it may be expected that the surplus mentioned will further increase in the near future. However, owing to its good crops this year, Argentina is basically in a position to effect much larger deliveries than before. It therefore remains to be seen how the balance of the offset account will move during the remainder of the year, especially if Argentina makes concessions in regard to prices, as it certainly must if its exports are to be increased. For the rest, the following table shows the course of payments with the bilateral offset account countries. As from the beginning of February

this year statements of this kind are regularly being published by the Bank deutscher Länder during the first few days of each month, to show the position of the offset accounts as at the end of the previous month. They are designed to give the German exporters some idea of the actual state of the offset accounts with the countries in question. It must however always be remembered that the accounting positions do not permit any direct conclusions as to the future, because they give only a momentary picture of a past situation; and experience shows that such situations can be rapidly changed by contrary movements in subsequent imports and exports. In February again the payments position of certain countries, which at the end of January had reached the limit of their "swing" or had even exceeded it, improved to such an extent that it was possible to avoid doing what in some cases threatened to become necessary, namely to institute "waiting rooms": that is to say, a procedure by which payments to exporters are postponed until the agreed currency has been provided by the other party. This applies in particular to Spain and Hungary. Yugoslavia on the contrary has further exceeded the agreed "swing", so that in its case new orders for payment have had to be put back until the position becomes easier again. It will however not be possible to draw up a "dynamic" statement of the position, which allows of somewhat fuller conclusions about the future than can be formed on the basis of the present statistics showing the position of the accounts, until it is found practicable to record the amount of and the changes in the outstanding contracts for imports and exports much better than this has hitherto been done.

During February there was no great change in the balance of payments in relation to the Dollar Area. The surplus increased by about \$ 4 million as compared with that for January, rising to something under \$ 26 million. At this level however it still remained lower than in the last three months of 1952, when our dollar balance of payments derived a great deal of benefit from the import of goods from the Dollar Area by way of Great Britain. The improvement as compared with January is moreover simply due to the fact that the short-term credits from the Export-Import Bank for the import of cotton and tobacco, which were taken last year, were repaid in January to the extent of a further \$ 5.4 million,

whereas in February no instalment of redemption was paid. The receipts of dollars owing to their exchange into DM by American agencies in Germany, which receipts are included in the figures for the net movement on foreign exchange accounts given above, and which have for some time been an item of importance in the German Federal Republic's dollar balance of payments, have scarcely shown any increase since last autumn, but of late have even somewhat decreased. In February they amounted to \$ 14 million, as against \$ 16.8 million in January, and \$ 17.3 million and \$ 13.3 million on the monthly averages of the fourth and third quarters of 1952 respectively.

# Arrangements for Future Imports, and the Terms of Trade

As regards the future position in respect of foreign trade and payments there is little to show that there will be any important change in the near future on the side of imports. During the last few weeks the amount of imports being currently arranged by traders and industrialists has again been relatively small. In February the issues of Purchasing Authorisations amounted to only DM 1,596 million, while those of Import and Payment Permits amounted to only DM 1,105 million. These totals compare with DM 2,062 million and DM 1,541 million respectively in January this year, and monthly averages of DM 1,940 million and DM 1,621 million respectively in the last quarter of 1952. Thus the amount of Import and Payment Permits issued fell short by some DM 56 million of the total of actual imports, which was itself relatively low. However, as the result of this, the amount of Import and Payment Permits outstanding and unused has hardly been reduced. At the end of February this year it stood at about DM 4,400 million, and was thus equal to more than four times the total imports in that month. There is thus no doubt that, from the point of view of the licences granted, Western Germany's traders and industrialists at present have considerable facilities for imports; and these will certainly make it much easier for them to take advantage of any good opportunities which may occur in the markets. However, the extent to which they use those opportunities will depend not only on the

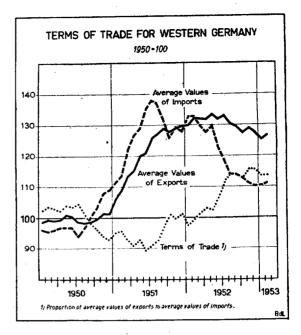

future movement in world market prices, but also, more particularly, on the course of economic activity inside Western Germany, and on the current demand for imported goods to which this will give rise. Neither of these two factors gives ground at the moment for expecting any large increase in imports.

On the other hand however it is hardly likely that the value of total imports will be much affected in the near future by further falls in prices on the international markets for raw materials. Some indication of the extent to which that factor affected the course of imports during the past year has already been given above. For instance, the total imports in terms of value in January and February 1953 were about 12 per cent less than in the corresponding period of last year, although the volume of imports in the same period was some 6 per cent larger. From now onwards however one can scarcely reckon on any similar reduction in imports owing to price falls. The reason is that for some time past, as is shown in the Chapter on Prices, world market prices have been growing notably firmer; and therefore one must on the whole expect for the present some stabilisation of the average value of imports, now that this has fallen by 15 per cent as compared with the second quarter of 1951.

It may be that the effect of this factor on the further course of the balances of trade and payments will be all the greater because, for some months now, the average prices of German exports have not been rising further, while of late there has actually been some slight tendency for them to decline. About the middle of last year for instance the prices of capital goods, which are much the most important among the goods exported, clearly reached the peak of their upward movement dating from the outbreak of the Korean conflict; and, the more the supply comes clearly to exceed the demand in the markets for these goods, and the more the official price increases recently made are "digested", the more the prices of capital goods will reflect the tendency towards price reductions which has already been apparent for some time among consumers' goods. Hence, from the side of both import and export prices the great improvement in Western Germany's terms of trade, which set in again after the end of the Korean boom, is more and more coming to an end. It is true that up to November 1952 the effect of the break in the upward movement of West German export prices which occurred in the summer of that year was outweighed by the way in which import prices continued to fall, owing to the great drop which took place in international prices, especially in the first half of the year. The result was that, as will be seen from the following table, the balance of trade for the fourth quarter of 1952 was better by DM 900 million than it would have been if the terms of trade of 1951 had still applied. However, with the gradual softening of the fall in import prices, and the simultaneous increase in the downward

pressure on the prices of German exports during the last few months, there has been a change in this respect; and since November the terms of trade applying to the external trade of the German Federal Republic and West Berlin have no longer been improving, but have for a time been actually growing worse. This does not mean that the deterioration will continue during the next few months, still less that it will become faster. Far too many imponderable factors are involved for it to be possible to venture on any such forecast. It does however seem reasonably certain that the course of Western Germany's balances of trade and payments within the near future will no longer benefit so much from the movement in the terms of trade as they did during the past year. This again brings out the necessity, which has so often been emphasised in these Reports,

to take utmost care in promoting exports, at least where they will bring in usable foreign exchange. It should in this connection be remembered that the balance of payments now has to bear a new and heavy charge on account of

the forthcoming resumption of the external debt service, as well as of other obligations towards foreign countries. If exports are not increased the result will be a deadlock — especially if in addition a growing demand for imports appears.

# The Financing of Investments in Fixed Assets during the Second Half of 1952

According to provisional estimates the amount of the gross investments in fixed assets rose from DM 11,800 million in the first half of 1952 to DM 13,700 million in the second half of that year. Thus they exceeded by about 14 per cent those made in the second half of 1951, which amounted to DM 12,050 million; and the gross investments in fixed assets during the whole year 1952 were 11 per cent greater than those in the previous year. After elimination of price changes the rate of growth was just under 5 per cent, whereas it was somewhat more than 20 per cent between 1949 and 1950, and about 13 per cent between 1950 and 1951. However, the ratio between the gross investments in fixed assets and the gross social product in 1952 amounted to some 20 per cent, which was almost as much as in the three previous years, and thus continued to exceed the investment ratio of most other countries.

According to the sources available, the net investments in fixed assets rose from DM 7,550 million in the first half of 1952 to roughly DM 9,100 million in the second half. However, although the value of the gross investment in fixed assets can be ascertained with adequate accuracy, the figures in regard to the net investments in fixed assets are based on less reliable data. Thus, the amount of the "normal depreciation" of fixed assets, by which the gross investments must be reduced in order to arrive at the net investments, has not been found by means of currently collected statistics, but merely by projecting forward to later dates figures which were ascertained some time ago. Hence this amount may considerably differ from reality. Accordingly the breakdown of the gross investments in fixed assets as between replacements and net new investments can give only an approximate idea of the degree to which investment led to the extension of plants, and hence of the amount of monetary capital which was required, in addition to the sums applied to depreciation, in order to finance the investments which took place. According to the available data, replacement investments accounted in the years 1949 to 1952 for fully one-third of all the investments in fixed assets; and thus the financing of the addition to fixed assets will have required roughly twice the sums which were currently realised as the proceeds of "normal depreciation".

During the period under report there were some noteworthy changes, by comparison with the preceding periods, as between the various sources of funds for the financing of investment. Some details on this aspect of the matter are given in the following table. According to these there was during the second half of 1952 a particularly large increase in the accruals of capital market resources, which accruals had been steadily declining since the middle of 1951. The result was that these resources, for the first time since the Currency Reform, exceeded the amount of the funds made available for investment out of the public budgets. This substantial increase must be ascribed in the first place to the growth

in the long-term lendings out of bank resources, and secondarily to the larger placings of securities, as well as to the credits granted in connection with the Investment Assistance by Industry.

The long-term lendings out of bank resources') rose from about DM 260 million in the first half

<sup>1)</sup> For a more precise delimitation see the Monthly Report of the Bank deutscher Länder for September 1952, page 41.

of 1952 to around DM 1,340 million in the second half of that year. Thus their proportion to the total amount of the funds used for financing investment went up to 14.7 per cent, as against only 3.5 per cent in the first half-year. This was due not only to the larger formation of monetary capital at the banks, but also to the fact that during the second half of the year the banks were evidently lending out at medium and long term a larger percentage of the savings accruing in their hands than in the first half of 1952, and in some cases even than in 1951. As the following table shows, the additions to savings deposits increased particularly in the second half of 1952. In the fourth quarter of that year alone they were larger, at a total of DM 886 million, than in the whole of 1951. Besides this, the other sources from which long-term bank lendings are derived were in general more abundant in the second half of 1952; and they included, for the first time, the funds arising from the Investment Assistance.

1) Excluding amounts accruing from the Currency Conversion, but including amounts credited as interest.

Another factor which notably contributed to the increase in the recent accruals of capital market resources was the sale of securities, including the placings of bank bonds. As will be seen from the table (p. 40) showing the sources of the funds, DM 637 million were made available from this source during 1952, as against DM 324 million in 1951. This large increase during 1952 mainly occurred in the second half of the year, when DM 482 million, or 5.3 per cent of all the funds required for net investments in fixed assets, arose from placings of securities. In 1951 on the other hand the proportion represented by such funds was only 2.1 per cent, and in 1950 no more than 1.6 per cent.

In order to avoid misunderstandings it may be mentioned that the item "placing of securities" in the table showing the sources of funds is not identical with the total of the securities placed according to the statistics of issues. In the first place, from the total as shown in those statistics there have been deducted the proceeds of all the issues in connection with which it was known that these were not used for investment purposes in 1952. In addition, no account has been taken of funds used for acquiring securities where these are already included in other items in the table, namely in the public budget resources or in the capital investments of insurance companies, in so far as funds from these sources were put into securities. Thus it is only that part of the proceeds of placings which was used for investment purposes, and which is not already shown in other items, that has been included in the item "placing of securities" in the table.

In regard to the movement in the total placings of securities, which placings were described in detail in the last Monthly Report<sup>1</sup>), some information is given by the following table. This shows that the placings in 1952, at DM 1,618 million, were larger than in the two preceding years together, the greatest increase having occurred in loans of public authorities, mortgage bonds and shares.

As part of the "Investment Assistance by Industry" for the benefit of the basic material industries DM 316 million were lent out in 1952, after DM 80 million had been made available in 1951 in anticipation of the future provision of funds from this source. The greater part of the monies so far paid out was channelled through the Reconstruction Loan Corporation, so that to that extent they contributed to an expansion of the long-term lendings by banks. The remaining,

<sup>1)</sup> After elimination of certain large subscriptions, where the taking over of the loan served solely to provide cover for advances previously given. A statement showing the breakdown of the placings of securities by quarters was published on page 28 of the Monthly Report for February 1953. — 2) Not including convertible bonds. — 3) Including the portion of the Federal loan, amounting to DM 159 million, which had been placed up to 31 December 1952.

smaller part was paid out directly to the beneficiaries from the Investment Assistance Special Fund. During the second half of 1952 about 3 per cent of the net investments in fixed assets were financed by means of Investment Assistance monies.

By comparison with the three sources of funds mentioned above, the contributions of other institutional investors, comprising the building and loan associations and the insurance companies, became less important during the second half of 1952.

During that half-year the capital sums paid out by the building and loan associations, at DM 236 million, were somewhat larger than in the first half of the year. The result was that, as the following table shows, the funds made available for capital investment by the building and loan associations, if reckoned in absolute terms, exceeded the level which they reached before the outbreak of the Korean conflict. In 1952 however the proportion which such funds bore to those required for net investments in fixed assets, at 2.7 per cent, was considerably lower than in the first half of 1950, when it stood at 4.0 per cent. Thus the out-payments by building and loan associations for capital purposes have so far been rising only gradually since their stationary periodin 1951; but the movement in fresh savings shows that some substantial increase in such payments may be expected in the current year.

During the fourth quarter of 1952 for instance the additions to savings amounted to DM 255 million, which was nearly twice as much as the

loans or amounts which these associations made available for building during the same period. It is true that in every year, as can be seen from the table, the accruals of savings are especially large in the fourth quarter — this being mainly due to the fact that the annual accounts of companies are then made up, and that tax concessions can be obtained in respect of amounts paid in for building purposes. However that may be, if one disregards the peaks at the end of each year, the movement in fresh savings shows an uninterrupted rise, which is gradually becoming steeper; and hence, even if the carry-over of employable funds mentioned above is left out of account, the trend of fresh savings by itself gives ground for expecting a further increase in the out-payments for capital purposes.

It is not yet possible to see how large a contribution to the financing of investments in fixed assets was made by the life and other insurance companies during the second half of 1952. In

the first half of that year they produced DM 311 million, or about 4 per cent of all the funds used to pay for net investments in fixed assets; and on the basis of the trend to date it may be assumed that during the second half of the year their contribution is likely, if anything, to have been somewhat greater. The following table gives some information regarding the course of the capital investments by life and other insurance companies, and as to how these were made up. The table shows in the first place that during the last few years the rate of growth in such assets has been rising steadily, although in a relatively moderate degree, having moved up from DM 414 million in 1950 to DM 565 million in 1951, and to DM 490 million in the first three quarters of 1952, which last represents a yearly rate of about DM 670 million. It also shows that in the course of the last few years there has been only slight change in the ratio between the various forms of investment and their combined addition

Source: Federal Supervisory Office for Insurance Companies and Building and Loan Associations (Bundesaufsichtsamt für das Versicherungs- und Bausparwesen. — ') These figures were compiled for the reporting period running from the second half of 1948 to the end of 1951 from the reports rendered in connection with Circular Sta R 1/52 of the Federal Supervisory Office dated 7 April 1952, and for the reporting periods in 1952 from the quarterly reports. The reports rendered in connection with Circular Sta R 1/52 represent a compilation of the data provided each quarter towards the annual results; and they contain corrections owing to entries subsequently made in the accounts, etc. This explains a compilation of the figures in earlier publications. — ') The breakdown according to the nature of the investments corresponds with the sections of the reports provided for the quarterly statistics regarding capital assets in the area of the German Federal Republic (without inclusion of the data as to Equalisation Claims). — ') The figures as to increases relate to the purchase price; those for decreases relate to the proceeds of sale, together with partly estimated data regarding capital repayments, for instance instalments of amortisation in the case of mortgages. — 's) Claims in bonded or loan form on the Federal Government, other public authorities, public and industrial enterprises, and financial and credit institutions. — ') According to the statistics of capital assets.

to the total. In each period, out of the addition to capital investments, about 30 per cent took the form of lendings against real estate, while some 30 per cent consisted of bonded claims on, or loans to, public authorities and industrial enterprises, and 15 to 20 per cent took the form of investments in securities. On the basis of the sample statistics regarding placing of securities, classified according to the takers, it can be assumed that during the last few months the investments of the insurance companies in securities have been rising to a greater extent than before. It will however be possible to make more precise statements about this only when the statistics of such capital investments are available. During the first three quarters of 1952, as in the preceding years, a preponderant part equal to 75 per cent of all the funds invested by insurance companies came from those handling life assurance, while 23 per cent came from insurance against various forms of damage and accident, and 2 per cent from disease and sickness insurance.

The contribution made to the financing of investments in fixed assets during 1952 by the Social Insurance Institutions and the Unemployment Insurance Fund, at DM 635 million, did not equal the amount of DM 685 million which they provided in the previous year. According to more recent and partly revised calculations, out of the total for 1952 DM 360 million arose in the first half of the year, while about DM 275 million were produced in the second half, for which period however only provisional and partial figures are yet available in regard to the net investments. Hence during 1952 the ratio which the funds made available by the Social Insurance Institutions and the Unemployment Insurance Fund bore to all the funds provided for investment purposes declined to 3.8 per cent, as compared with 4.5 per cent in the previous year. This fall was mainly due to the fact that in 1952, owing to the redemption of old debts1), the Unemployment Insurance Fund was able to provide only a quite small amount of money for investment purposes, although previously it had produced a large part of the capital investments made by the Social Insurance Institutions. Thus, during the first half of 1952 the Unemployment

Insurance Fund accounted for only about 5 per cent of all the capital investments of Social Insurance Institutions, including those of the Unemployment Insurance Fund itself; and in the second half of the year it took no share in these at all. Much the largest contribution to the financing of investment was made by the Workers' Pension Insurance Fund, from which there came about two-thirds of all the funds for investment made available by the Social Insurance Institutions in the first half of 1952, and something over 50 per cent in the second half of that year. The remainder came mainly from the Employees' Insurance Institution.

It is true that the contribution to the financing of investment which was made by the Social Insurance Institutions and the Unemployment Insurance Fund goes somewhat further than the amounts indicated above. These in fact represent only their acquisitions of securities, which account for much the largest part of the additions to their investments, plus the direct lendings by the insurance companies. In addition however these bodies keep a part of their investable resources in the form of deposits in banks, especially time deposits. The resources so held are not included in the capital investments of the Social Insurance Institutions as here shown, because these deposits, in so far as they have been made available for investment purposes in the form of banks' long-term lendings, are already included in the item "long-term lendings by banks", and it is not possible to separate them from the other sums lent by the banks in this way. Thus the existence of this practice in regard to the making of investments somewhat reduces the indicative value of the item in question, and indeed also that of the other data relating to the capital investments of the Social Insurance Institutions.

The amount of Counterpart Funds made available for the financing of investments during 1952 was DM 548 million, as against DM 820 million in 1951, and DM 1,771 million in 1950. Out of these funds 15 per cent of the net investments in fixed assets were financed in 1950, or not quite 10 per cent of the gross investments in such assets; but in 1952 the proportion was only 3.3 per cent. The fact that such relatively large amounts could still be provided at all from Counterpart Funds was due in the first place to

<sup>1)</sup> For details see the Monthly Report of the Bank deutscher Länder for January 1953, page 27.

the surpluses of in-payments in earlier years, these having formed a reservoir which, even after the great reduction in the amount of foreign aid, could still be tapped to provide resources for investment purposes. Moreover, even after Marshall aid came to an end in 1952, there was still a steady flow of in-payments into the Counterpart accounts, making possible further outpayments. During recent months however the out-payments have in general substantially exceeded the in-payments, so that the reservoir in question is more and more drying up. At the end of 1952 the total balances still standing on the Counterpart accounts were DM 757 million. The prospect is that only relatively small additions will be made to these balances, so that the contributions to investment from this source will decline further in importance.

The share taken by the public budgets in the provision of funds for investment purposes, which share rose with only slight interruptions until the middle of 1952, and which according to new calculations1) amounted during the first half of that year to 31.2 per cent of the net investments in fixed assets, declined slightly during the second half of the year to 30.8 per cent. In absolute terms, it is true, the amount so provided showed a substantial increase, having risen from DM 2,355 million in the first half of 1952 to DM 2,800 million in the second. In the course of this movement the funds provided by the Federal Government were more than doubled as between the first and the second halves of the year, while those coming from the municipalities and communes were increased by a half. By way of contrast, the investment expenditure of the Immediate Assistance Office and of the Equalisation of Burdens Fund showed a comparatively large drop, while that of the Lands declined slightly. The decrease in the amounts coming from the first of the two sources was partly due to the fact that the proportion of the expenditure on investment is smaller in the case of the Equalisation of Burdens than in that of the Immediate Assistance; and in part it resulted from certain difficulties of transition which, as seems probable, have now been mostly overcome.

The public expenditure on investment is in fact still large, even though the proportion which funds from this source bore to the total of those provided for net investments in fixed assets showed no further increase during the second half of 1952, but on the contrary even declined to some extent. The size of that expenditure is due in the first place to the fact that in the public sector of the economy large arrears of capital expenditure still remain to be overtaken. This is because it has so far not been possible to carry out, to anything like the necessary extent, the reconstruction and extension of transport facilities, as well as the building of schools, hospitals and other public buildings. In addition to this the amount of the public expenditure on investment depends in part on the provision of budgetary funds to finance the building of dwelling houses for social purposes. During past years the use of public funds has served to make good the lack of private capital to pay for housing projects. To the extent to which the formation of private capital makes progress it should now be possible to reduce the amount of budgetary resources spent on housing.

During 1952 the whole of the monies arising from public budgets, the capital market and Counterpart Funds, that is to say, all the statistically ascertainable long-term funds from outside sources, plus those from the budgets, provided, more than DM 10,000 million, or about 60 per cent of all the sums required to pay for net investments in fixed assets. In the second half of that year these sources actually provided more than DM 6,100 million, or 67 per cent, of such net investments, whereas in 1951 the corresponding proportion was only about 54 per cent. This increase was mainly due to the growth in the amount of capital market resources available in the second half of 1952, and to a lesser extent to the comparatively large amount of funds which were provided by public authorities. Funds of the Central Banking System in the form of anticipatory credits, which contributed during both the preceding years to the financing of investments, were no longer provided during 1952.

<sup>1)</sup> This new calculation was necessary because, as the result of information published in the meantime as to the investment expenditure during the so-called overlap period, that is to say, the investment expenditure which was carried to the account of the past financial year after that year had already ended, the amount previously estimated, and the allocation of that amount to the heads of current investment expenditure as shown in the financial statistics for the individual quarters of the year, had to be revised. In addition the statistics showing the financial results of the municipalities and communes, which are now available, made it necessary to correct the previous estimates. One result of the new calculation was that, even as regards past years, it became necessary to reduce the amount shown for the funds which were used for investment purposes out of ordinary budget receipts.

After all the sources of funds so far mentioned and described in detail have been added together, there still remains an unexplained "residual item". In 1952 this represented about 40 per cent of the value of the net investments in fixed assets: it was found by a purely arithmetical process as the difference between the amount of such net investments and the total of the capital sums, recordable in statistical form, which were made available for purposes of investment in fixed assets. Hence any errors of estimation in other items may be reflected in this residual item. In 1952 again one of the most important components in the funds for the financing of investment which cannot be statistically recorded consisted of surpluses in the hands of firms and companies which were either temporarily available, for instance as a reserve against subsequent tax payments, or permanently available, that is to say, as genuine undistributed profits, and which were used inside the same firm or company to pay for expenditure on the extension of fixed assets thus constituting "financing out of own resources" in the narrower sense of that term. No reliable data are available in regard to the amount of the funds so used, nor as to changes. in that amount. Apart from this the residual item also contains what are known as "7(c) and 7(d) monies", which are provided by private persons or companies without the interposition of banks or other institutional investors. These monies are used to make non-interest-bearing loans or contributions for the purpose of building dwelling houses or ships; and the taxpayers who provide them are entitled, in the year in which they do so, to deduct them from their taxable incomes in accordance with Articles 7(c) and 7(d) respectively of the Income Tax Law, or of the corresponding provision in the Corporation Tax Law. The amount of the funds provided in this manner has been steadily growing during the last few years; and it seems likely to have exceeded the figure of DM 1,000 million in 1952. The residual item also includes short-term bank credits, and other private monies lent or contributed for the purpose of financing investments in fixed assets. None of the component elements in this omnibus item so far mentioned can be ascertained for past years in anything like a reliable manner, even as regards the order of their magnitude. For this

reason it is not possible to draw from changes in that item any safe conclusions as to alterations in the practices followed in the financing of investment. If however one considers the drop in the figures for the residual item between 1951 and 1952, and again between the first and second halves of the latter year; and if one bears in mind that within that item a rather important part may recently have represented funds not comnig from business enterprises, or funds provided by business enterprises to other such enterprises about to engage in capital investment; then there is a good deal of evidence to show that there must have been some decrease in 1952, as compared with 1951, in the amount of the funds available for financing investment "out of own resources". In so far as this assumption is correct, the shift which this indicates in the composition of the resources used for financing investment may be regarded as a step towards a re-establishment of normal conditions in that process.

In the present state of the collection of statistics it is not possible to ascertain how funds were provided to cover the difference between the net and gross investments in fixed assets, that is to say, the replacements which were entailed by the wearing out of such assets. The amounts which are described in the table showing the sources of funds as "normal depreciation" need not correspond with the total of the amounts actually written off. It can no doubt be assumed that the greater part of the investments for replacement purposes, which at present account for about one-third of the gross investments in fixed assets, were financed out of depreciation. On the other hand, in some cases depreciation funds will not have existed to the extent required by the amount of wear incurred; and in other cases larger sums will have been written off than would have been normally justified by the extent to which the fixed assets became worn out. Thus the item "normal depreciation" merely indicates what funds could be estimated to have been available in respect of depreciation, if the amount of the latter had been determined by that of the actual wear and tear. In so far as the total of the amounts actually written off may have exceeded the depreciation required by such wear and tear, the funds thus obtained are included with others in the residual item.

<sup>\*)</sup> Alterations as compared with previously published figures are due to subsequent corrections. — 1) Excluding Bank deutscher Länder and Land Central buying. Also excluding almost all of those Agricultural Credit Cooperatives which had on 31 March 1948 a balance-sheet total less than RM 2 million, separate returns, which lie in the territory of a Land Central Bank different from that in which their Head Office is located. However, in the group as one institution only. — Alterations arise through merging of institutions, through taking out credit institutions which are no longer required to balances at medium and long term. — 5) After deduction of Equalisation Claims sold or redeemed. — 6) Owing to changes made in the method of colleting are available at the end of each quarter only. — 7) Including claims in foreign currency existing since the RM period. — 10) Only new transactions entered into since the Currency Reform.— 11) Institutions established placed to Reserve for Specific Liabilities, and Adjustments of Values and items for balance sheet adjustment in respect of branches located outside publication of the re-foundation balance sheets by the Large Banks as of 25 September 1952 entailed, in addition to the change in the number of Assets and Other Liabilities, Bank Acceptances, Capital Funds, Own Acceptances in Circulation. — 15) After elimination of transitory credits of a the various credit transactions, the credits in question were taken out of the accounts by two Central Giro Institutions at the end of January 1953 as Lands Baden, Württemberg-Baden and Württemberg-Hohenzollern.

<sup>\*)</sup> Alterations as compared with previously published figures are due to subsequent corrections. — 1) Excluding Bank deutscher Länder and Land Central buying. In addition almost all of those Agricultural Credit Cooperatives are distegarded which had on 31 March 1948 a balance-sheet total less than Head Office is located. However, in the group "Supra-Regional Institutions with Special Functions", which are not included in any Land's figures, all institutions which are no longer required to render returns, or through adding new institutions which are required to render them. — 3) Cash, and balances showing the holdings of Equalisation Claims according to Conversion Account are available at the end of each quarter only. — 7) Short and medium-respect of branches located outside the Land. — 9) After elimination of transitory credits of a purely administrative nature (totalling about DM 880 miltaken out of the accounts by two Cenral Giro Institutions at the end of January 1953 as not forming part of the balance sheet. — 10) Decline due to — +) For further breakdown into "Successor Institutions to Former Large Banks", "State, Regional and Local Banks", and "Private Bankers", see table

<sup>\*)</sup> Alterations as compared with previously published figures are due to subsequent corrections. — 1) Excluding Bank deutscher Länder and Land Central buying. In addition almost all of those Agricultural Credit Cooperatives are disregarded which had on 31 March 1948 a balance-sheet total less than Head Office is located. Alterations arise through merging of institutions, through taking out credit institutions which are no longer required to render at medium and long term. — 5)After deduction of Equalisation Claims sold or redeemed. — 6) The figures showing the holdings of Equalisation Claims Capital Depreciation Account, unpaid capital, own shares, etc., and items for balance sheet adjustment in respect of branches located outside the Land. about 42 per cent of the deposits and 40 per cent of the lendings are not covered by the statistics. Figures for all Agricultural Credit Cooperatives Willyttemplace, Radon and Willyttemplace, Hobertrallern. Württemberg-Baden and Württemberg-Hohenzollern.

<sup>\*)</sup> Alterations as compared with previously published figures are due to subsequent corrections. — 1) Excluding Bank deutscher Länder and Land Central buying. In addition almost all of those Agricultural Credit Cooperatives are disregarded which had on 31 March 1948 a-balance-sheet total less than RM Office is located. However, in the group "Supra-Regional Institutions with Special Functions", which are not included in any Land's figures, all branches tions which are no longer required to render returns, or through adding new institutions which are required to render them. — 3) Columns 33 to 41 existing since the RM period. — 5) Only new transactions entered into since the Currency Reform. — 6) Institutions established after the Currency Specific Liabilities, and Adjustments of Values" and items for balance sheet adjustment in respect of branches located outside the Land. — 8) Includes credits of a purely administrative nature (totalling about DM 880 million) from the balance sheet item "Transitory Credits". As the result of an of January 1953, as not forming part of the balance sheet. — 10) Decline due to decrease in the number of branches rendering separate returns in to Former Large Banks", "State, Regional and Local Banks", and "Private Bankers", see table overleaf. — O) Breakdown is shown overleaf.

<sup>\*)</sup> Alterations as compared with previously published figures are due to subsequent corrections. — 1) Excluding Bank deutscher Länder and Land Central buying. In addition almost all of those Agricultural Credit Cooperatives are disregarded which had on 31 March 1948 a balance-sheet total less than Head Office is located. Alterations arise through merging of institutions, through taking out credit institutions which are no longer required to render accordance with the nature of the original RM deposits. — 4) Includes liabilities in foreign currency existing since the RM period. — 5) Only new bank (Agricultural Mortgage Bank), etc. — 7) Includes "Other Reserves, Amounts placed to Reserve for Specific Liabilities, and Adjustments of Values" earmarked for specific purposes, which have not yet been passed on. — 9) The statistics cover 1,629 institutions out of a total of 11,157 Agricultural the statistics. Figures for all Agricultural Credit Cooperatives are shown in Table 1 e). — 10) Decline due to decrease in the number of branches rendering

Banks, excluding Postal Savings Bank Offices and Postal Cheque Offices, Reconstruction Loan Corporation, Finag, and institutions financing instalment RM 2 million. — 2) Including branches rendering separate returns, which lie in the territory of a Land Central Bank different from that in which their returns, or through adding new institutions which are required to render them. — 3) Columns 33 to 41 include also the deposits on Blocked Account in transactions entered into since the Currency Reform. — 6) Institutions established after the Currency Reform, such as the Landwirtschaftliche Rentenand items for balance sheet adjustment in respect of branches located outside the Land. — 8) Includes funds possibly contained in "Deposits" and Credit Cooperatives as at 31 December 1952. In terms of volume, about 42 per cent of the deposits and 40 per cent of the lendings are not covered by separate returns in the area of the former Lands Baden, Württemberg-Baden and Württemberg-Hohenzollern.

#### 1. Credit Institutions in the Area of the German Federal Republic (cont'd)

Monthly Banking Statistics\*)1); Collected jointly by the Bank deutscher Länder and the Land Central Banks from the Credit Institutions in the Area of the German Federal Republic (In millions of DM)

## b) Deposits of Non-Bank Customers at Credit Institutions in the Area of the German Federal Republic, classified by Maturities (Excluding Savings Deposits)

<sup>\*)</sup> Alterations as compared with previously published figures are due to subsequent corrections. — 1) Excluding Bank deutscher Länder and Land Central Banks, excluding Postal Savings Bank Offices and Postal Cheque Offices, Reconstruction Loan Corporation, Finag, and institutions financing instalment buying. Also excluding almost all of those Agricultural Credit Cooperatives which had on 31 March 1948 a balance-sheet total less than RM 2 million. The proportion of the institutions thus disregarded to the balance-sheet total shown in the tables is very small.

\*\*) Excluding deposits of Agricultural Credit Cooperatives, contained in columns 1 and 4, for which no breakdown according to columns 7 to 14 is available. — 3) For 1951, breakdown of time deposits (columns 7 to 14) is available at the end of each quarter only; as from February 1952, at quarterly intervals. — 4) Sight deposits are considered to be monies payable on demand and deposits for which a period of notice of less than 30 days, has been agreed. — 5) In October 1951, a number of banks not previously covered were newly included in these statistics. In order to show the resulting statistical increase, figures as at 31 October 1951 are published both for the former and for the present circle of institutions required to render returns.

<sup>\*)</sup> Alterations as compared with previously published figures are due to subsequent corrections. — 1) Alterations arise through merging of institutions or through adding new institutions which are required to render returns. — 2) Not identical with the similarly named balance-sheet item. Includes all those items of the return which are not specified in the table.

<sup>\*)</sup> Alterations as compared with previously published figures are due to subsequent corrections. — 1) Excluding Bank deutscher Länder and Land Central Banks, excluding Postal Savings Bank Offices and Postal Cheque Offices, Reconstruction Loan Corporation, Finag, and institutions financing instalment buying. Also excluding almost all of those Agricultural Credit Cooperatives which had on 31 March 1948 a balance-sheet total less than RM 2 million. The proportion of the institutions thus disregarded to the balance-sheet total shown in the tables is very small. — 2) Includes medium-term transitory credits. — 3) Mortgages, loans based on communal security, other long-term lendings, and long-term transitory credits. — 4) Includes a statistical increase of about DM 60 million due to a transfer in the books of one institution. — 6) Includes a statistical increase of about DM 31 million due to a transfer in the books of one Central Giro Institution. — 8) After elimination of transitory credits of a purely administrative nature (totalling about DM 880 million) from the balance sheet item "Transitory Credits". As the result of an examination of the various credit transactions, the credits in question were taken out of the accounts by two Central Giro Institutions at the end of January 1953 as not forming part of the balance sheet.

<sup>\*)</sup> Alterations as compared with previously published figures are due to subsequent corrections. — 1) Excluding Bank deutscher Länder and Land Central buying. In addition almost all of those Agricultural Credit Cooperatives are disregarded which had on 31 March 1948 a balance-sheet total less than term transitory credits. — 4) After elimination of transitory credits of a purely administrative nature (totalling about DM 880 million) from the balance accounts by two Central Giro Institutions at the end of January 1953 as not forming part of the balance sheet.

<sup>\*)</sup> Alterations as compared with previously published figures are due to subsequent corrections. — 1) Excluding Bank deutscher Länder and Land Central buying. In addition almost all of those Agricultural Credit Cooperatives are disregarded which had on 31 March 1948 a balance-sheet total less than term transitory credits. — 4) After elimination of transitory credits of a purely administrative nature (totalling about DM 880 million) from the balance accounts by two Central Giro Institutions at the end of January 1953 as not forming part of the balance sheet. — +) For further breakdown into "Succes-

<sup>\*)</sup> Alterations as compared with previously published figures are due to subsequent corrections. — 1) Excluding Bank deutscher Länder and Land Central buying. In addition almost all of those Agricultural Credit Cooperatives are disregarded which had on 31 March 1948 a balance-sheet total less than term transitory credits. — 4) The statistics cover 1,629 institutions out of a total of 11,157 Agricultural Credit Cooperatives as at 31 December 1952. Cooperatives are shown in Table 1 e).

<sup>\*)</sup> Alterations as compared with previously published figures are due to subsequent corrections. — 1) On 31 December 1952, the short-term lendings of the 780 credit institutions represented 81.7 per cent of the volume of short-term credit. — 2) The medium and long-term lendings include only new lendings made since the Currency Reform. — 3) After elimination of transitory credits of a purely administrative nature (totalling about DM 880 million) from the balance sheet item "Transitory Credits". As the result of an examination of the various credit transactions, the credits in question were taken out of the accounts by two Central Giro Institutions at the end of January 1953 as not forming part of the balance sheet.

<sup>1)</sup> Differences from information published earlier are due to correction. The table does not include the DM 360 million which the Federal Railways received out of GARIOA monies to pay for imported waggons, nor does it contain the DM 100 million of GARIOA monies which Berlin received, in May 1951, for financing investment credit. — 2) As from August 1951, included in the amounts passed on through Reconstruction Loan Corporation.

referential Rate of Interest ranted by Cooperatives and rivate Bankers	On basis of principles laid down by the Reich Credit Supervision Office for the granting of preferential interest, dated 23 April 1940, in the version of 4 March 1941.	On basis of principles laid down by the Reich Credit Supervision Office for the granting of preferential interest, dated 23 April 1940, with amendments dated 4 March 1941 and 15 November 1941.	1/4 maximum	Preferential interest, at a maximum of \$\frac{1}{4}\%0\$, may be granted by those private banking firms and Credit Cooperatives in whose case the total deposits of their customers, according to paragraph 2 (2) of the Instructions regarding Minimum Reserves issued on 23 December 1948 by the Land Central Bank of the Hanse Town Hamburg, die not exceed DM 1,000,000 on 31 December 1948.

<sup>1)</sup> Compiled from data furnished by the Land Central Banks on the basis of notifications concerning the fixing of interest and commission rates Lands as the result of creditor interest rates having been fixed at differential levels, banks may either a) in the case of customers residing out-of residence, meet bids from banks in another Land by quoting rates up to the maximum rates in force in that Land, in so far as the customer panies, the interest rates for non-bank customers must be observed. — 5) The rates mentioned against c) and d) may only be granted in cases at least six months, from the date of the agreement. Otherwise only the rates for fixed monies (4c or 4d) may be credited. — 6) For German

maximum  Preferential interest may be granted by those banks which, on the basis of their Balance Sheet of 31 December 1947, are entitled to do so according to the "Principles Governing the Granting of Preferential Interest".	Preferential interest at 1/4 %/0 may be granted by Credit Cooperatives (except Central Institutions of Credit Cooperatives) and small and middle banks with a balance-sheet total of up to DM 20 million, on monies payable on demand, moneys at notice and monies placed for fixed periods as well as savings deposits. The balance-sheet total will be determined by the last annual closing balance. Private banking firms may exceed by up to 1/2% the maximum interest rates provided for monies at notice and monies for fixed periods, and by up to 1/4% the maximum interest rates provided for savings deposits.	1/4	Preferential interest may be granted in accordance with the notice issued on 23 April 1940 by the Reith Credit Supervision Office regarding the agreement of 23 Dec. 1936 on creditor interest rates, with the qualification that the balance-sheet totals named therein as limiting the rate of preferential interest are reduced to \(^1/10\)th of their previous amount.	Preferential interest, at a maximum of 1/4%, may be granted by those private banking firms and Credit Cooperatives in whose case the total deposits of their customers, according to paragraph 2 of the Instructions regarding Minimum Reserves issued on 20 March 1950 by the Land Central Bank of Schleswig-Holstein, didnot exceed DM1,000,000 on 31 December 1948.

published by the Bank Supervisory Authorities of the individual Lands. -2 Maximum rates. -3 To prevent an efflux of money into other side the Land apply the maximum rates which are in force in the Land where the customer is resident, or b) without regard to the Customer's place proves that the has received offers exceeding the maximum rates in force in his own Land. -4 In the case of transactions with insurance comwhere the customer does not take advantage of the right to demand repayment - in the case of c) for at least three months, in the case of d) for Banker customers outside the Hamburg region:  $1^{1}/4^{0}/0$ . -7 For Banker customers  $1^{1}/4^{0}/0$ . -8 For Banker customers  $1^{3}/4^{0}/0$ .

<sup>1)</sup> The Equalisation Claims have as a rule been allocated to that Land in which the institution in question has its seat. Thus the survey largely disregards the allocation of the Equalisation charge to several Lands in accordance with

a) Art. 10. paragraph 5 of Regulation 2 under the Conversion Law (in respect of credit institutions with branches in several Lands),

b) Art. 8 of Regulation 35 under the Conversion Law (in respect of Postal Cheque Offices),

c) Art. 6, paragraph 2 of Regulation 46 under the Conversion Law (in respect of Postal Cheque Offices),

furthermore the internal allocation of the Equalisation charge in respect of insurance companies and building and loan associations in accordance with Art. 10 of Regulation 23 and Art. 3 of Regulation 33 under the Conversion Law. 2) See footnote!) to table a) above. 3) See footnote 7) to table a) above; in accordance with Art. 4 of Military Government Law No. 67 the Federal Government receives a debt certificate of the territorial authority of Greater Berlin for the same amount. 4) See footnote 8) to table a) above. 5) See footnote 11) to table a) above. 6) Amount excluding the debt certificate in favour of the Federal Government as mentioned in footnote 3). 7) See footnote 11) to table a) above.

<sup>1)</sup> These are also the conversion rates in force for invoicing in dollars in commercial transactions with the German Federal Republic including West Berlin, except for Switzerland, where U.S. Dollars are converted into Sw. Fcs. on the free Dollar rate as quoted in Switzerland. — \*) Earliest date: 21 June 1948 (monetary reform under the Issue Law). — \*) Computed from the basic rate of the currency in relation to the U.S. \$ and from the fixed relationship of the DM to the U.S. \$. No official rates of exchange have been established by this indirect computation. — \*) Exports. — \*) Fixed relationship of the DM to the U.S. \$.

#### Note

The third part of this survey has in the meantime been supplemented. In consideration of the space element it is no longer included in the Monthly Reports. Instead, the entire survey is drawn up quarterly as a special print and will be currently forwarded to the Land Central Banks, the Berlin Central Bank, and the foreign trade banks, to be used for the information of interested customers.
