The Economic Situation in the Area of the German Federal Republic in October and November 1954

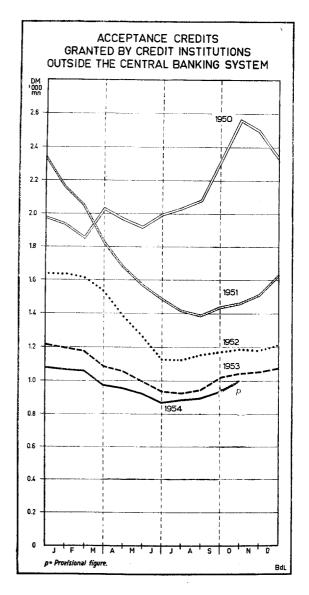

Money and Credit

Bank Lendings

During the period under report the short-term lendings of banks to business and private customers, after having increased in September and also in part of October more than in the preceding years, were growing at a slow rate only. According to the semi-monthly banking statistics, which it is true relate only to 480 institutions having approximately a two-thirds share in the total volume of short-term bank lendings, the increase in these during the second half of October was just under DM 2 million, as compared with DM 174 million in the first half of October and DM 445 million in September; and in the first half of November the addition was only DM 74 million. This falling off is in accordance with the usual seasonal trend, namely that when the financing of the crops comes to an end the expansion in credit usually grows weaker, and does not set in again more strongly until December with its "big tax date" and the Christmas trade. This accordingly confirms that the higher rate of increase in lendings to which attention was drawn in the last Monthly Report was largely seasonal, while, as was mentioned at the time, the customary seasonal increase was no doubt made greater by the delay in the start of crop financing.

At the same time the trend of economic activity would seem still to be tending to produce a somewhat greater demand for credit than hitherto. A factor which is of special importance in this connection is the rather considerable rise which has taken place in imports during recent months. It is doubtless due to this cause that for some time past there has been a somewhat more than seasonal growth in the amount of acceptance credits, which are used in a special degree for the financing of imports; this growth, as the graph shows, followed a substantial decline that had taken place in the last few years. The lively course of economic activity has not however as yet had much effect on the amount of lending.

If one compares the increase in short-term lendings to business and private customers during the three months from August to October this year with that in the corresponding period of last year at all the credit institutions covered by the monthly banking statistics, which account for more than 95 per cent of the total volume of bank lendings, one finds that their total of DM 709 million was up by only DM 73 million on the year. This was scarcely any more than what

For data for previous months and for explanatory remarks, see the Tables under VI and VIII in the Statistical Section of this Report ("Consolidated Condition Statement for all Credit Institutions" and "Notes and Coin in Circulation, and Bank Deposits"); also the Report of the Bank deutscher Länder for the Year 1953, pp. 32 and 42.

1) Including funds accruing from the redemption by the Federal Equalisation of Burdens Office of claims in respect of cover; not including, however, accruals of amounts credited as compensation to expelled persons and to "old" savers. __") Deposits at fixed period, or at notice, of at least one month. __" At notice, or fixed period, of 6 months and over. __") Including Counterpart Funds. __" As from 1950, this item also includes the change in the circulation of the notes issued in West-Berlin, since these notes are no longer recorded separately. __" as from mid-1954 including West Berlin. __") Position at end of quarter or month, in per cent of the DM nominal value. __" Not taking into account payment, in August, of some DM 18 million to the International Monetary Fund. __" Not taking into account payment, in May, of some DM 175 million to the International Monetary Fund. __" Not taking into account the increase due to the credit granted to the Federal Government in respect of the DM 193.6 million already paid to the International Monetary Fund. __" Not including special credit granted to the Federal Government in respect of DM 14 million paid to the International Monetary Fund. __" Not including since account payment of DM 14 million to the International Monetary Fund. __" Not including soft credit institutions. __" Total placings since Currency Reform (20 June 1948). __" Provisional figures.

corresponded with the growth in the quantity of the national product. During the said period this year moreover the short-term credits extended by banks to public authorities decreased by DM 52 million, whereas in the corresponding period of last year they increased by DM 107 million.

The medium and long-term lendings of the banks, including the mortgage institutions, savings banks and central giro institutions, continued to grow steadily during the period under report. The fact that the growth in them was greater than in the preceding months is not only in accordance with the rising trend of formation of monetary capital at the banks, but in addition, as was mentioned in the last Monthly Report, it also conforms to the seasonal tendency. A large proportion of these lendings in fact represents mortgage loans, the amount of which naturally grows when large numbers of buildings are completed at the close of the building season. It is true that here again, if one compares the increase with that of a year previously, the difference is not so great as one might prima facie have perhaps expected in the light of the increased formation of capital and the greater activity in investment. Indeed the medium and long-term lendings by banks during the last three months, at DM 2,035 million, have shown a further increase of only DM 25 million; and, even if the comparison is made between the increase during the whole of this year to date and that in the first ten months of 1953, the difference of DM 173 million between the figures of about DM 5,570 million and some DM 5,400 million is only slight1).

The circumstance mentioned is due in the first place to the fact that this year a part of the loans which under the Investment Assistance scheme of 1952 were passed through credit institutions such as the Reconstruction Loan Corporation in particular, and were therefore shown as bank loans, have this year been consolidated in an amount of about DM 345 million through the delivery of bonds of the recipients of loans to the Investment Assistance creditors, and have therefore disappeared from the bank balance sheets.

Had it not been for this consolidation, therefore, the increase in the medium and long-term lendings would have been greater by a corresponding amount.

Growing Importance of Other Sources of Credit

What however is even more significant is that for some time past a presumably growing part of the capital formation process has no longer been touching the banking system, since the funds are instead passing directly to the borrowers from the savers, or from institutional investors not included in the banking system. Two methods in particular are followed in this connection. First there is the direct issue of securities by the

¹⁾ The increase given for this year in the comparison does not take account of the fact, mentioned in the last Monthly Report, that certain public loans to a value of about DM 400 million were taken over into the balance sheets of banks, because these loans absorbed no fresh bank funds.

parties engaging in the capital expenditure; this process, so far as trade and industry are concerned, mainly takes the form of issuing industrial bonds and shares and placing these with takers other than banks. Secondly there is the taking of other direct loans from private persons and business enterprises, as well as from institutional investors such as life, indemnity and accident insurance companies, Social Insurance Institutions, the Unemployment Insurance Fund and the building and loan associations.

In this matter there are clear statistics as to the extent to which issues of securities establish a direct lending relationship between savers or institutional investors on the one hand and the parties engaging in capital projects on the other. Regular reports are given on this subject in the light of our security statistics; and in the present Report some further details will be given as to what has been happening most recently. On the other hand the figures relating to direct lendings by the institutional investors not belonging to the banking system are comparatively inadequate, and in general are also not so up to date as the statistics about bank lendings; this is because in some cases they do not adequately break down the lendings, in that for instance they do not classify them as between lendings to banks and those to other parties, while some of them are published only at the end of a certain interval after the period which they cover. It is however precisely these lendings which at present merit particular attention, because it is clear from the available evidence and from practical experience of the growing importance of direct mortgages. loans secured by simple recognisance of debt and similar forms of financing, coupled with the growing activity of financial intermediaries, that a much larger part than before of the capital funds that are being invested is now flowing through these channels. The effect is to cause a certain decline in the proportionate share of bank lendings, and to some extent also of direct security issues.

By way of supporting evidence some examples may be quoted from the existing material, although as already stated there are gaps in this, and in particular it unfortunately does not yet throw any light on the most recent happenings. In the case of the Social Insurance Institutions

and the Unemployment Insurance Fund the ad dition to mortgage and other loans granted to non-bank borrowers rose from DM 115 million in the first half of 1953 to DM 250 million in the first half of 1954. Over the same period the lendings of the building and loan associations increased from DM 63 million to DM 161 million, while their total of DM 142 million in the third quarter of 1954 actually exceeded by DM 63 million their total in the third quarter of 1953; and the new lendings of life assurance companies to parties other than banks, excluding lendings secured by mortgage, land charge or annuity charge, grew from DM 140 million in the first half of 1953 to DM 216 million in the first half of 1954. In all these cases therefore the

rate of increase is substantially greater than that in the lendings by banks at medium and long term. Only in one of these cases, namely in that of the building and loan associations, would the principal cause seem to lie in the fact that the savings accruing to them increased more in proportion than did savings as a whole. In the case of the other institutional investors a fact of more importance was that at least since the end of last year the practice in regard to investment has changed, inasmuch as the institutions in question now appear to be employing relatively less funds than formerly at banks or through

banks, lending more either direct or through intermediaries other than the banks. For example in the first half of 1954 the new lendings of life assurance companies to banks before deduction of repayments amounted to DM 55 million, which was not very much greater than the DM 38 million so lent in the first half of 1953; but, as already mentioned, over the same time their fresh lendings to non-banks rose from DM 140 million to DM 216 million. It is however in particular the fact that for a year now the time deposits at banks have no longer been rising but have on the whole actually declined which can be taken as evidence that there has been a change in the practice of many institutional investors as to how they employ their funds, the reason being that such institutions may be assumed to have held an important place among depositors on time accounts. It is true that a large part of the funds which according to the previous practice would probably have found their way into time accounts are now put into mortgage bonds or communal bonds, and that therefore they are once more channelled through the banks, since such securities are bonds of these latter. But investment in this way has evidently not offset the relative and in part even absolute decrease in the total deposits, the difference having been mainly reflected in the above-mentioned increase in the institutional investors' direct lendings.

Up to the present however the direct procurement of capital by trade and industry through the securities market has increased in only slight degree. During the period under report the amount of borrowing in this form was indeed once more definitely small. Industrial bonds were in fact offered in October to the value of only DM 8 million. These, as had to be expected in view of the present state of the market, were immediately placed. The amount of shares issued and placed was no more than DM 7 million. These totals fell well short of the monthly averages of DM 40 million of industrial bonds (other than those issued for Investment Assistance purposes) and DM 28 million of shares which were issued and placed — the figures for issues and placings being in general the same - in the first nine months of this year. This was in spite of the fact that even in that period the extent of recourse to the market had already been strikingly small. Reasons for this state of affairs have repeatedly been given in the last few Monthly Reports. They lie chiefly in the fact that at the moment trade and industry can still finance their needs more cheaply through bank loans or direct borrowing from institutional investors, even though this method may probably entail the risk of incurring a liability for repayment at relatively short term, while many traders and industrialists are evidently still not interested in increasing their share capital, much as their lack of capital funds is to be regretted.

The Other Sections of the Securities Market

In these circumstances it was again mortgage bonds and communal bonds which held the field during the period under report so far as placings of securities are concerned, more especially because of late scarcely any public loans have been issued. Placings of mortgage bonds amounted in October to DM 147 million, and those of communal bonds to not quite DM 54 million. They were thus smaller than in the two previous months, when the figures of placings already fell short of those for June and July, which had been exceptionally high owing to a number of special factors; but they were substantial by comparison with those for the early months of this year or for 1953.

On the other hand the offerings of new mortgage bonds in October, at DM 180 million, were considerably greater than the total for the two previous months; this was because the issuing institutions made greater use of the facilities for issue accorded to them under the quota for the issue of tax-free mortgage bonds, which was fixed by the Federal Ministry for Economic Affairs in July this year. No new series of communal bonds were offered. This was because owing to the large amount of communal bonds issued but not yet placed, coupled with the fact that very large amounts of them had been already placed in the first half of this year, the decision to impose a quota in July completely stopped the issue of new tax-free communal bonds, which up till then had made up by far the greatest part of the total issues of this type of security. In spite of this the offerings of both mortgage bonds and communal bonds still remain considerable. At the end of October the amount of mortgage bonds issued but not yet placed still stood at DM 490 million, while the corresponding figure for communal bonds was DM 369 million. Besides this, some DM 150 million out of the quota of DM 400 million which was fixed for issues of mortgage bonds in July had also not been used. Altogether therefore the actual and potential supply of mortgage and communal bonds on 31 October 1954 amounted to more than DM 1,000 million, that is to say a sum about four times as great as the actual monthly average placings of such securities during the previous three months. The fact that some of these securities have already been sold "in advance" is of no importance in this connection, because such advance sales represent simply an agreement as to the future taking of bonds; and they therefore make no difference at all to the amount of securities on offer which will have to be absorbed by the capital formed during the next few months. There is the further point that for certain purposes, such in particular as that of financing capital projects in trading and industrial enterprises owned by local authorities, and also for the purpose of funding indebtedness on account of housing, various additional issues of mortgage bonds and communal bonds carrying the fiscal privileges laid down in the Capital Market Encouragement Law have after all recently been approved; and in addition two specialised institutions have come out with new loans amounting to a total of DM 70 million. The market will therefore have a plentiful supply of securities still available up to the time when the first securities no longer carrying the privileges authorised by the Capital Market Encouragement Law expiring on 31 December this year are offered; and such offerings could be made without further formality immediately after the beginning of next year.

It would therefore be highly regrettable if an attempt were made at the last moment to effect still further issues on the terms of the Capital Market Encouragement Law. While in most cases the issuers would no doubt have no pressing need of capital, such issues would still further burden the market; and they would do so at a time when, on the contrary, all superfluous offering of securities ought to be avoided, so as to ensure that the market shall be strengthened enough to ensure

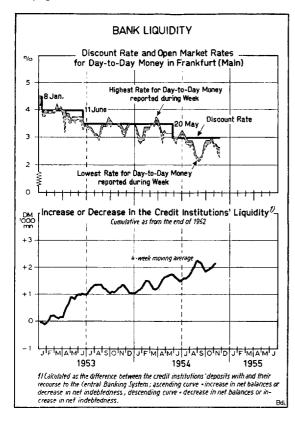

that the forthcoming issues of securities no longer enjoying tax privileges shall have as good a start as possible. Already, partly no doubt as a result of the announcement of various new issues, the prices of fixed-interest-bearing securities have of late no longer been rising, but in some cases have even slightly fallen; and in the context stated this fact ought certainly to convey a clear warning.

But even from the point of view of the issuers themselves there would scarcely be any advantage in raising capital funds simply because they are afraid that the terms for raising such funds might possibly become less favourable. During the past two years such precautionary borrowings have greatly slowed down the process of easing the capital market, and thereby in the long run have operated only to the disadvantage of the issuers. And even in these circumstances many issuers, who thought that they would do well to raise capital early, would have done better to postpone their issues, because if they had done so they would have been able to place them on more favourable terms and would moreover have saved the loss of interest which they suffered in the meantime. There is every likelihood that the same will apply to the future also because the rate of interest on capital, which at present is still affected by the great shortage of capital market resources that prevailed during the first few years of reconstruction, undoubtedly has a tendency to decline. It might therefore be more prudent to wait until there is real need before entering the market, the more so since general observance of this rule would help towards easing the market position all the sooner.

Bank Liquidity and the Money Market

During the last few weeks the banks' liquidity has varied somewhat considerably, although this has not altered the picture of a degree of liquidity which is high as compared with previously. In the second half of September and the first half of October the "big tax date" on 10 September and the considerable decrease in the accruals of foreign exchange at first gave rise to appreciable tightness. Towards the end of October however this gave place to a new period of liquidity which lasted into the second half of November; and at present the demands on liquid

resources which are usual in December are already beginning to make themselves felt. These fluctuations therefore are in large measure those which are customary at this season, and which scarcely merit detailed discussion. Statistical details can be readily seen in the graph below and the table on page 10.

There have however been certain changes taking place for some time past in the basic tendency of some of the most important factors determining the liquidity of the banks. The only reason why these changes have not so far affected the basic trend of the banks' liquidity to a greater extent is that their effects on the supply of Central Bank money to the credit institutions have cancelled each other out, although this result was a matter of chance rather than due to any basic interrelation of the determining factors. Thus in the first place the net accruals of foreign exchange to the Central Banking System, which for a long time had been the main cause of the substantial increase in the banks' liquidity, have been much smaller during the last few months than before. In July and August of this year they still amounted to DM 280 million and DM 257 million respectively. In September they declined to DM 201 million; in October to DM 117 million; and in the first three weeks of November their total was DM 59 million, so that their weekly average was again somewhat less than in the previous month. Foreign exchange purchases by the Bank deutscher Länder have accordingly been putting much less Central Bank money into the hands of the credit institutions during the last few months than in the first half of this year and in the summer, although this process still represented a substantial source of liquid funds for the banking system.

At the same time there has been at least an underlying tendency for the burden on the banks' liquidity due to the demand for notes and coin on the part of trade and industry to become greater. In the first half of this year the note and coin circulation rose only slightly after the usual large seasonal decrease in January; in fact at about the middle of the year it still stood somewhat lower than the peak which it had reached last December. During the summer months again the increase was still comparatively small. In September and October however the circulation increased quite strongly; and in November the position became only about stationary, whereas in other years it has been usual for a decrease to occur in that month before the December peak. In large measure no doubt this increase which has occurred since the summer in the demand for notes and coin is seasonal. Up to a certain point however it evidently has been and still is being strengthened by the fact that for some time past the income of the masses has again been growing quite vigorously, while experience shows that the demand for notes and coin largely depends on the size of that income.

On the other hand however the liquidity position of the banks has benefited during recent months from the fact that the public deposits in the Central Banking System have no longer been rising anything like so much as during the period between the middle of 1953 and the middle of 1954, but have at times even considerably decreased. Some details were given in the last Monthly Report as to the reasons for this change in the tendency. They lie mainly in the fact that during past months the Federal budget has in general been showing appreciably smaller cash surpluses than before, and that in particular the

1) Not including the need for rec-	ourse to the Ca	neral Banking					

¹) Not including the need for recourse to the Central Banking System resulting from the minimum reserve requirement. — ²) Including monies employed in Equalisation Claims; excluding Counterpart Accounts of the Federal Government. — ³) Counterpart Accounts of the Federal Government and E.R.P. Special Account of the Berlin Central Bank. — ⁴) Allied agencies, other depositors in Western Germany, and foreign depositors. — ⁵) Credits for work creation, housing and other investment projects. — ⁶) Net balance of the following items: gold, credit balances with foreign banks (including credit balances with E.P. U.), foreign hotes and coin and foreign cheques less credit balances of foreign banks, export letters of credit, U.S. dollar accounts Brazil, U.S. Dollar accounts of Foreign Trade Banks, and other foreign exchange accounts.

Equalisation of Burdens Fund has by now spent much the greatest part of its credit balance at the Bank deutscher Länder, which at the middle

of this year still amounted to around DM 600 million. This decrease was also of great importance to the course of liquidity in November because, whereas in this month the public deposits in the Central Banking System usually rise strongly as a result of the quarterly date for collection of the Equalisation of Burdens Levies, this time the funds arising from that source have been flowing back into circulation with relative rapidity. During recent months therefore the effect produced in increasing liquidity by the Central Banking System's net purchases of foreign exchange has been offset by the temporary neutralisation of public funds to only a comparatively slight extent; and therefore over a more extended period the slowing down in the accruals of foreign exchange has scarcely produced any noticeable effect on the course of liquidity, in spite of the fact that the note and coin circulation has at the same time been rising. In fact during the periods in which the public deposits in the Central Banking System have declined in relatively large measure, as for example during the last ten days of October and the first ten days of November, the basic tendency towards liquidity connected with the balance of payments surpluses has again prevailed.

As regards the further course of liquidity it is admittedly necessary at the moment to expect appreciable tightness, because in December both the movement in the note and coin circulation and the growth of public deposits in the Central Banking System resulting from the "big tax date" are certain to place a substantial strain on the liquid resources of the banks. In order to conform to that situation, the Bank deutscher Länder has slightly raised its selling rates for money-market securities at shorter term with effect from 29 November 1954. At the beginning of the new year however the position will probably change again, because then the demand for notes and coin at least is likely for a time to decrease considerably. It remains of course to be seen whether, and if so to what extent, this factor may be assisted by any further increase in the accruals of foreign exchange or by the course of the public finances.

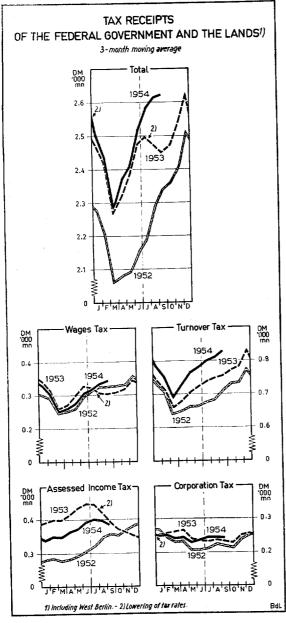

Public Finances

As has been indicated in the previous chapter, the movement in the public finances during the period under review again confirmed that since the middle of this year the large public cash surpluses which in the last two years were one of the most important factors affecting monetary conditions as a whole have been clearly tending to decline. The determining cause of this movement has continued to be the relatively large cash expenditure of the Federal Government and the Equalisation of Burdens Fund. In November for example in the case of this Fund the quarterly date for the payment of levies produced only slight effect on the cash position, because by far the greater part of the receipts for that month, which may be estimated at around DM 400 million, was absorbed by the cash expenditure in the period. The cash resources of the Fund therefore remained substantially below their level at the end of August, the last month containing comparable dates for payment, when the total cash resources had already fallen substantially short of their peak level in May of this year. It was mainly because of this that since the middle of the present year, as was shown in more detail in the last Monthly Report, the public deposits have been rising only slightly. In fact, so far as they are kept in the Central Banking System, they have even slightly declined if one leaves out of account the resources of the E.R.P. Special Fund and of the Chief Cash Office of the Postal Administration. If in addition one eliminates the increase which resulted from the granting of a special credit to the Federal Government in respect of payments previously made by the latter to the International Monetary Fund, then for the three months from August to October there was actually a decrease of DM 207 million in the Central Bank deposits of the public authorities. It is also true that for some time past the public authorities have been borrowing to only a small extent, whereas last year borrowings contributed appreciably towards causing the rise in their deposits, because in most cases the monies in question were for a certain time not in fact required. During the last few months on the other hand the total amount of credit taken by public authorities on the money and capital

markets has remained almost unchanged, while between the end of July and the end of October the direct borrowings from credit institutions increased by a smaller amount than in the corresponding months a year earlier. So far however as the public deposits consist of resources of the Social Insurance Institutions, the fact that they have grown by only a relatively slight amount in the course of this year to date is due neither to current surpluses having become smaller nor to refraining from precautionary borrowing, since the financial position of these institutions continues to be good, while they have never so far taken any credit. The chief cause is rather that since the spring, under the influence of the lowering of the banks' deposit rates of interest, the surpluses of these institutions have been employed to a larger extent in lendings or investment in securities, while at times their bank deposits have for this reason actually shown a fall.

Tax Revenues and the Tax Reform

During the period under report the tax revenues of the Federal Government and the Lands, with regard to which monthly returns are published, again clearly reflected the effect of the favourable course of economic activity. In October, at a total of DM 2,367 million, they were once again larger than in the previous months containing comparable payment dates. In fact they exceeded the total for October 1953 by some DM 130 million, or 5.8 per cent. The increase as compared with a year earlier took place however almost entirely in the yield of the Turnover Tax, which was up by DM 80 million or nearly 10 per cent, and in that of the Wages Tax, where the rise was DM 40 million or roughly 12 per cent: that is to say, the taxes whose yields follow the growth in economic activity with comparative rapidity. By way of contrast the produce of the Assessed Income Tax fell short not only of the total in October of last year, but also of the result for July this year, which was the last comparable month. On the average of the past three months however the amount produced by this tax has again approached very close to the level in the corresponding period of last year.

Out of the total amount of taxes of the Federal Government and the Lands in October an estimated DM 1,780 million, or approximately three-quarters, went to the Federal Government. The effect was to bring the total tax revenues received by the Federal Government in the first seven months of the current financial year, running from April to October 1954, up to DM 12,250 million, or around 56 per cent of the amount appearing as due to be received in the budget for the present financial year. In the light of experience of the tax revenues accruing in the course of earlier years this result affords a certain assurance that the total estimated by the Federal

Finance Minister in this year's budget will be achieved, although up to the present it is not possible to say with certainty whether the surprisingly favourable state of economic activity will cause the actual tax revenues to exceed that estimate. One important factor of uncertainty is for example the extent of the seasonal decline in employment, since this can vary quite considerably according to the state of the weather. A further point to bear in mind is that the proceeds of the Turnover Tax for the current year were estimated at a level higher by about 8 per cent than those actually obtained in the 1953/54 financial year, and that this already allowed for a large increase in total turnover. A final fact which may affect the position a good deal is that the tax reductions which were recently voted by the Bundestag (Lower House), although they still require approval by the Bundesrat (Upper House), go beyond the extent for which the Federal Finance Minister allowed; and moreover, if these reductions receive the assent of the Bundesrat in good time, they will be producing a clear effect on the yield of taxation as early as February of next year, because in this case the new rates of tax approved will be immediately applied from the beginning of next year. However, the months of December and January in particular will still show very substantial tax receipts, if only owing to the timing of payments and for seasonal reasons; and these receipts will probably provide a certain counter-balance against any major shortfalls in the last months of the financial year.

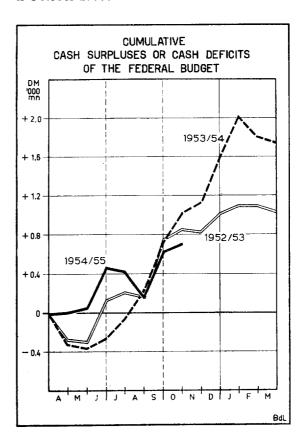

The Tax Reform, on which the Bundestag took a decision on 19 November after long and keen discussions, goes beyond the bill originally introduced by the Federal Government in the following points in particular. In the first place the scale of tax on incomes of up to DM 36,000 a year has been reduced by a larger amount, the main effect being to afford additional relief for incomes in the lower and middle groups. Besides this various allowances and other deductible portions of income have been fixed on a more generous scale. Mention may be made in particular of the increase by a further DM 240 to a total of DM 1,680 per annum, compared with DM 840 at present, in the allowances for the third child and each further child; the according of an allowance on account of age at the rate of DM

720 per annum for persons more than 70 years old, and an allowance of up to DM 1,200 per annum for persons engaged in liberal professions; the deduction of costs of journeys by motor vehicle between the place of residence and the place of work as professional expenses; and the exemption from tax in respect of additional payments for work done on Sundays, public holidays and at night in the case of annual incomes of up to DM 7,200. In addition the more thorough method proposed by the Government for the joint assessment of married people has been rejected, and it has been decided to tax only one of the spouses according to Taxation Class I (single persons). The "split rate" of Corporation Tax, which the Federal Finance Minister wished to see abandoned in order to make good the shortfalls in tax revenue due to the more far-reaching lowering of tax rates, is to be retained. Consequently as from 1 January 1955 the profit of corporations will be taxed, as originally proposed by the Government, at the rate of 45 per cent as against 60 per cent at present; so far as such profit is distributed, it continues to be taxed at 30 per cent. The Federal Minister of Finance has estimated at some DM 1,100 million for a full year the additional shortfalls which will be caused for the Federal Government and the Lands by this decision and by a number of other individual reliefs as compared with the original bill submitted by the Government.

The Federal Finances

During the period under report, as has already been mentioned, the Federal Government's cash position continued to be characterised by the rise in cash expenditure which has been apparent for some months. In October the cash expenditure amounted to about DM 1,810 million, which was greater than in the corresponding month of last year by DM 262 million or some 17 per cent, after having in the previous quarter already exceeded its total for the corresponding quarter a year earlier by approximately DM 800 million, which also amounted to 17 per cent. The prospect for November is again that the expenditure will be greater than in the corresponding period of the year before, although the difference this time does not seem likely to be quite so large as in the preceding months. It is true that the Federal

budget still shows cash surpluses because during the last few months the expenditure as a whole has continued to be less than what was estimated in the budget, while the receipts from taxation are also exceeding their last year's amount, mainly owing to the favourable course of receipts from the Turnover Tax, which go entirely to the Federal Government. At all events, in October there was a cash surplus of some DM 74 million; and in November too, to judge by the movement to date, the receipts have once more exceeded the expenditure, in spite of the fact that owing to the timing of payments both these months are poor in tax receipts. Even so, for some considerable time the surpluses have been appreciably smaller than in the corresponding periods of last year, or in other periods when the payments falling due were comparable. In fact in the four months from July to October the total cash surpluses reached only DM 245 million, as against DM 1,292 million in the corresponding four months a year earlier — the surplus in October this year, as already mentioned, being DM 74 million as compared with roughly 285 million in October 1953.

1) For monthly figures and for technical explanations, see Table XI, 2, in the Statistical Section. — 2) Partly revised on the basis of the figures of the 1953/54 budgetary account; the claims on the Debt Register subsequently allocated under the Law of 29 June 1953 and charged to the financial year 1952/53 have been included in the figures for September 1953. — 3) Unemployment Insurance Fund only.

Some indications have already been given in the last Monthly Report as to the causes of the rise in expenditure. They consist mainly in the fact that during the present financial year to date the Federal Government has regularly made its payments to the Social Insurance Institutions in cash, and not as last year partly by delivering claims on the Debt Register, coupled with the fact that for some months considerably larger amounts have had to be spent for occupation purposes. Details as to the size of the occupation costs are now available up to September. According to these the total amount spent by the Federal Government in respect of expenditure chargeable to the occupation costs quota, i. e., not including the Berlin occupation costs or the "related costs", amounted on the monthly average of the period from July to September this year to DM 477 million: this compares with a monthly average of DM 421 million for the past financial year, including the overlap period, and an average of only DM 377 million for the months from July to September 1953. The increase is mainly due to the fact that for some time now the capital expenditure of the occupying powers has evidently been appreciably larger than in the corresponding periods of last year, when such expenditure was meeting with various hindrances. There is however every likelihood that even now the

actual monthly expenditure for occupation purposes is still at least DM 100 million less than the monthly average of DM 600 million agreed with the occupying powers. The result is that the carry-over of unused occupation cost votes, which according to recent announcements by the occupying powers would seem to have amounted to DM 3,340 million at the end of September this year, is apparently growing further; and therefore against the current cash surpluses of the Federal Government there continue to be substantial accruals of latent expenditure liabilities. It is however hardly likely that these latent liabilities could give rise to heavy simultaneous demands on the Federal Government, in such a way as to render probable a sudden and abrupt increase in the latter's cash expenditure, causing rapid liquidation of its cash holdings. According to statements by occupying agencies the greater part of the carry-over is set aside for purposes of capital expenditure; but the carrying out of capital projects, and the accounting for them, always cover a considerable period. There is the further fact that it is in the interest of the occupying powers to be economical in using the amounts of DM which are at their disposal, because after Germany's accession to N.A.T.O. the current German contribution towards the costs of stationing Allied troops is to fall within a year to zero,

so that the existence of resources carried over from the preceding era will make the transition a good deal easier for them1). The effect of the provision that amounts so carried over may be used within a period of up to twelve months after the expiry of the first year of German membership in N.A.T.O. is to ensure that the spreading of the expenditure of the resources in question over a longer period in this manner is possible in accordance with budget law. It is therefore in fact doubtful whether the current cash expenditure for occupation purposes will substantially rise in the near future above its present average level of perhaps DM 500 million per month. If it does not, then it will still be possible for some time to effect certain cash savings as compared with the budget vote, so that at least until the Tax Reform comes into effect it is probable that the Federal budget will continue to show cash surpluses. It is however clear that the savings in this connection will not be definitive, because there is every likelihood that at the latest during the first and second years in which Germany belongs to N. A.T. O. the whole of the reserves which have at present been formed will have to be used.

The Federal Budget Estimates for the Financial Year 1955/56

For the purpose of assessing the future course of the Federal finances it is also of interest to look at the draft budget for the financial year running from 1 April 1955 to 31 March 1956, which the Federal cabinet passed at the beginning of November and forwarded to the Bundesrat (Upper House). It must however be emphasised that this draft may still be subjected to important amendments while it is under consideration in the legislative chambers.

A condensed synopsis of the draft in question is given in the table which follows. From this it will be seen that the estimates balance with approximately DM 27,800 million on the side of both receipts and expenditure, so that the budget total is greater by about DM 600 million than in the estimates for the present financial year. At the same time the offsetting items in the Federal budget, which appear in equal amounts

on the side of receipts and expenditure, amount to DM 2,140 million, which is somewhat more than this year. If these items are disregarded in order to arrive at the budget receipts and expenditure in the narrower sense of those terms, the result is a budget total of DM 25,644 million. This is about DM 530 million more than in the estimates for the current financial year; but it is DM 2,800 million more on the side of receipts, and nearly DM 2,200 million more on that of expenditure, than the final results of the financial year 1953/54 which ended on 31 March last.

Like the estimates for this year and those for all preceding financial years, those for next year also contemplate a deficit to be covered by borrowing. Altogether it is calculated that such borrowing will amount to DM 1,568 million as compared with DM 2,020 million in the estimates for the present year (see items I, 4 and 6 in the following table). Against this amount however there are on the expenditure side roughly DM 240 million for redemption of debt, compared with some DM 210 million in the current year, so that the net increase in indebtedness is estimated at only about DM 1,330 million by comparison with DM 1,810 million in this year's estimates. The incurring of debt for next year is to be confined entirely to borrowings in the money and capital markets. For the current year on the other hand, apart from such "credit market indebtedness", there was also provision for borrowing DM 512 million from other public authorities, namely the Social Insurance Institutions and the Unemployment Insurance Fund, although no use has so far been made of this power as regards the authorised borrowing of DM 250 million from the Social Insurance Institutions.

At the moment it is of course still a quite open question, as indeed was recently stated by a spokesman of the Federal Finance Ministry, whether from the point of view of the cash position it will become necessary during the next financial year to borrow to the contemplated extent of about DM 1,570 million gross and DM 1,330 million net. The decision on this point depends not only on how large a decrease there may be in the Federal Government's cash reserves, which are at present very substantial, although subject to a latent charge in view of the lag in the Allies'

In the form recently passed by the cabinet. The estimates may yet be substantially amended before they are finally passed by the legis-

demands for occupation costs. Nor does it depend only on the extent to which the cash results of the Federal budget may correspond with the estimates of receipts and expenditure, quite apart from any possible amendments to those estimates by the legislative chambers. During the last two financial years there have consistently been large cash surpluses in spite of the fact that sizable deficits were computed from the budget estimates as voted. At present it is of course quite impossible to forecast whether the position in 1955/56 will be even approximately similar.

To take the receipts side first it must be borne in mind that the Federal Finance Minister when drawing up the present draft budget estimates allowed for a smaller reduction in the Income Tax than that on which the Bundestag recently resolved, and which may possibly receive the assent of the Bundesrat. It is however true that only a minor part of any additional fall in tax revenues will affect the Federal Government, because most of the proceeds of the Income Tax during the next financial year will continue to go to the Lands. A further point to remember is that it is difficult to estimate in advance the real size of the shortfalls in revenue which will result from the Tax Reform, and that therefore it remains to be seen how large the receipts during the next financial year will in fact be.

In particular however much will depend on the actual amount of occupation and defence costs. In the cabinet's draft budget these, so far as they relate to the area of the German Federal Republic, have been entered at the same figure of DM 9,000 million at which they appeared in this year's and last year's estimates. In the past financial year

¹⁾ In the form recently passed by the capital. The estimates may record substantially many feelings and provided from the form recently passed by the capital from property and from levies for adjusting differences on the price of imported foodstuffs. — 3) Including the non-cash expenditure for "Covering deficits of previous years" and the payments to the International Monetary Fund and International Bank for Reconstruction and Development, but excluding the non-cash expenditure for social purposes shown in item 5d. — 4) Financial assistance to Berlin, subsidies and costs of stockpiling, compensation payments and administrative expenditure. — 5) Only credit market indebtedness. — 6) Excluding amounts set aside against unused votes (see II, 4b). — 7) Including DM 140 million charged to the financial year 1952/53.

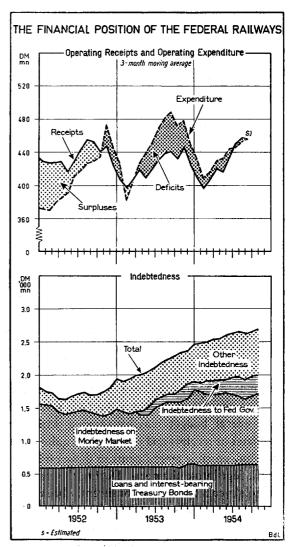

however, if one disregards the amount of DM 1,863 million which the Federal Finance Minister set aside in the accounts to cover unused occupation cost votes, the amount so provided was used to the extent of only about DM 5,200 million. This was because the occupation cost expenditure fell far short of the agreed amount, while the sums provided for E.D.C. were not required at all. In the current financial year again it is hardly likely that the expenditure for occupation and defence purposes will exceed DM 6,000 million. Next year however this position is likely to change, since expenditure for the purpose of building up a German contingent of troops will now arise. In this connection the present provisional estimates would allow a margin of DM 3,000 to 4,000 million for growth in actual expenditure, since they provide DM 9,000 million as compared with estimated cash expenditure of DM 5,000 to 6,000 million in the last and the current financial years; and this margin may be increased by some addition to the current German contributions towards costs of stationing Allied troops as a result of gradual use of the hitherto unused occupation cost votes. It remains to be seen how far it will be technically possible to use this margin without too much stepping up of domestic demand; but it is highly probable that in the course of the coming financial year the cash expenditure of the Federal Government will rise substantially above its present level, which is already appreciably higher than in the previous year.

Federal Railways and Federal Postal Administration

The financial results for the third quarter of the calendar year were published during the period under report for the great Federal enterprises, the Federal Railways and the Federal Postal Administration¹). In the case of both enterprises it is characteristic that there has been a continuance of the slight improvement in the relationship between current receipts and expenditure which was already apparent in the first half of 1954. It remains necessary to bear in mind however that the Federal Railways' financial

position continues to be extremely strained, this being closely connected with the structural difficulties in that branch of transport.

Nevertheless, in the third quarter of 1954, for the first time in more than a year, the operations account of the Federal Railways showed a small cash surplus amounting to DM 12 million, whereas on this account in the corresponding period of last year there was a deficit of DM 130 million. The causes of this improvement lie both

on the receipts and on the expenditure side. The operating receipts of DM 1,375 million were not only larger than in either of the two preceding quarters — which to a certain extent was only in accordance with the usual seasonal trend — but also exceeded the receipts in the corresponding period of the previous year by the considerable margin of about DM 58 million or 4.4 per cent.

¹⁾ A statement of the results for the first and second quarters of the calendar year 1954 were given in the Monthly Reports of the Bank deutscher Länder for May and August, respectively, of this year.

This increase arose almost entirely on the receipts from goods traffic, while those from passenger traffic in the third quarter only approximately maintained their level of the corresponding quarter a year ago after having risen quite substantially in the first half of this year. Evidently the chief reason for the rise in the receipts from goods traffic was the high level of activity in basic materials, including building materials, iron and steel, coal and so forth. At all events there was a particularly large increase in the receipts from the conveyance of bulk goods. But in addition the cash expenditure on operations account1) during the third quarter of 1954, at DM 1,363 million, fell short by some DM 84 million of that in the corresponding quarter of 1953. Up to a certain point this was due to the fact that in the course of their efforts to effect rationalisation the Federal Railways have been able to reduce their expenditure on operations by about DM 24 million as compared with a year earlier in spite of the increase in the amount of traffic handled. The decline in expenditure was however mainly due to a reduction in the total amount spent on maintenance and renewal of installations, although there are of course limits to the possibility of such reduction in view of the need to preserve the value of material assets.

Moreover, the small surplus which the Federal Railways achieved in the third quarter of this year was nothing like sufficient to cover the expenditure under the head of profit and loss account, mainly comprising that on debt service, and the expenditure on new capital work. The new capital expenditure alone amounted to DM 94 million, or somewhat more than in the corresponding quarter a year earlier. The result was a further rise in the indebtedness of the Federal Railways, which increased by about DM 26 million in the third quarter and by a further DM 46 million in October. Consequently at the end of October it reached a total of nearly DM 2,700 million, not including matured liabilities of some DM 400 million. Still, the growth of indebtedness during recent months has been appreciably less than a year ago, when almost

constantly a deficit of greater or lesser size on operations account had to be financed by borrowing. The composition of the indebtedness has also improved further during the past months, since the increase in the total debt has taken place exclusively in the liabilities at medium and long term, while the floating debt has continued to decrease.

In the case of the Federal Postal Administration the operations account in the third quarter of this year showed receipts and expenditure of DM 792 million and DM 722 million respectively, so that here also there was a surplus, whereas in the corresponding period of last year there was a deficit of roughly DM 4 million. improvement is due to the fact that the operating receipts have continued their rising movement which began this spring, with the result that in the third quarter of this year they were larger by some DM 94 million or 13.5 per cent than in the corresponding period a year previously. In addition to the general rise in activity a factor which played a certain part in causing this improvement was the increase in charges as from 1 July this year. On the other hand the operating expenditure has increased scarcely at all, or only slightly, by comparison both with the two previous quarters and with the third quarter of 1953. In the profit and loss account moreover, where the most important items of expenditure are interest — both on the Postal Administration's

¹) Excluding the non-cash expenditure shown by the Federal Railways for maintenance and renewals not carried out; but including cash expenditure for the purpose of overtaking arrears of maintenance and renewals.

own indebtedness and on the Equalisation Claims for which it has to meet the service — and subventions to the Berlin Postal Administration, the relatively large size of the surplus on operations account in the third quarter resulted for the first time in two years in a substantial net profit of DM 46 million. The whole of this was applied to financing new capital investments. The total expenditure on such investment was however considerably greater at about DM 83 million, or nearly twice the amount which was spent for such purposes in the corresponding period of last year. For the purpose of financing this expenditure it was accordingly again necessary to resort to

borrowed monies to the considerable extent of DM 48 million, so that by the end of September this year the indebtedness of the Federal Postal Administration had risen to DM 1,393 million, as compared with DM 1,126 million at the end of 1953 and DM 966 million at the end of September in that year. Out of the increase in the third quarter of this year DM 38 million was in loans at medium and long term, which were taken mainly from banks but partly also from the Federal Institution for Employment Exchanges and Unemployment Insurance, while the balance took the form of medium and short-term borrowing from banks.

Production, Sales and Employment

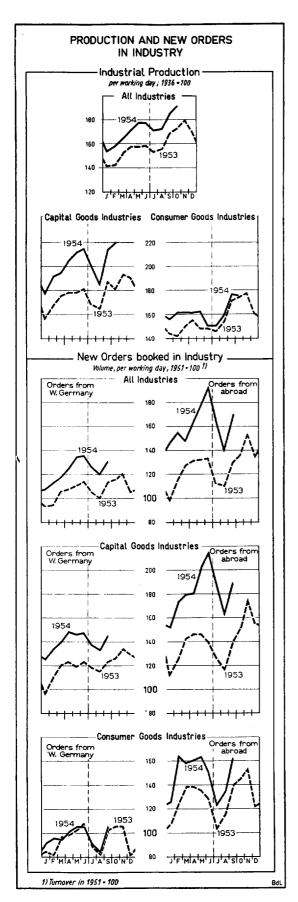

During the last few weeks the general economic situation continued to be characterised by the upswing which, since August this year, has been considerably reinforced by seasonal influences. The clearest indication of this is the increase in industrial production. In October the index for such production calculated by the Federal Statistical Office reached a new high which is above the level at the corresponding date a year earlier by more than 11 per cent. In November also this index would seem to have risen a little further, although the amount of activity in building has already in October passed its seasonal peak, at least so far as regards the bare shells of buildings. During the next few weeks on the other hand not only the industries dependent on building and the processing of farm products but also in particular the consumer goods industries will cut down their output, once these latter have delivered the last of the goods for the Christmas trade; and therefore it is likely that for a month or two, just as in every previous year, the seasonal tendencies to contraction will once again prevail over the forces of expansion resulting from the upward economic trend.

Continuing Vigorous Rise in Output in the Capital Goods Industries

During the period under report the capital goods industries and those producing basic materials and producers' goods continued to be most prominent in the upward trend of activity.

The result was that in all these categories the level of production in the corresponding month of the previous year was far exceeded. In some cases this had the effect of so fully engaging the existing capacities that it is no longer possible without any question to satisfy quite so promptly as hitherto the growing demand, which occasionally is no doubt greater than the actual consumption. Consequently the periods for delivery here and there have become somewhat longer. In addition more recourse is sometimes being had to the possibilities of importing. In the case of rolled steel products for example the overall export surplus has been replaced during the last few weeks by an excess of imports.

An important factor in causing the total demand for capital goods and basic materials to rise continues to be the demand from foreign countries. At all events in September, the last month for which figures are available, the amount of new orders booked from that quarter was greater by about a third than in September of last year. Besides this however, as is shown by the movement in new orders, the domestic demand has also increased further, because the activity in capital investment has reached a stage at which it so to speak tends to generate further investment by its own momentum. Indeed the more closely production approaches the limits of capacity, the greater is the growth in the demand for further capital investment, and therefore for capital goods. That is also the reason why capital

projects for the extension of plants are now once more an important factor even in fields where they were regarded not so long ago as superfluous, or actually uneconomical, and where capital expenditure seemed to be justified at the most only where it would reduce costs. But there also continues to be an increase in the amount of capital works for rationalisation purposes, because it is becoming constantly clearer that the exhaustion of labour reserves is appearing as the cause of the most troublesome bottleneck that might be encountered in the near future in the course of the effort to enlarge the limits of capacity, which after all have never been rigid. That is why efforts are being made to raise the production per worker through appropriate technical improvements. And accordingly the machine building industry, the output of which in 1953 did not merely remain stationary but was on the whole actually less than in 1952, has for some months past again been one of the industries which are joining most strongly in the general rise of activity.

Production in the Consumer Goods Industries still lagging behind

In the consumer goods industries on the other hand the general state of activity continues for the present to be rather on the poor side. In October, contrary to the usual seasonal tendency, their output did not rise further; and it remains to be seen whether this stagnation will be made good by any substantial increase of production in November — the more so since in that month their output is as a rule already beginning to pass its seasonal high point. At all events in October the output of the consumer goods industries was scarcely any higher than in the corresponding month of the previous year; and even on the average of all the months in this year to date it is only some 5 per cent above the corresponding level for 1953.

Output of these proportions is in comparatively close accordance with the bookings of new orders. It is true that in September, to which the latest figures relate, the bookings of orders in the consumer goods industries rose considerably. This rise however was scarcely any greater than is usual at the season; and therefore, just as in the previous months of this year, the volume of

orders placed was once again only very slightly greater than that for the corresponding month a year before. The chief reason for this is that retail turnover is still lagging behind the upward movement in turnover as a whole, while traders are still taking pains to keep their stocks as low as they can. Again in October, the last month for which figures are at the moment to hand, the increase of turnover in retail trade was relatively small, particularly as regards the goods turned out by the industries recorded in the index of production as producing consumer goods. The total value of retail trade turnover in October exceeded that for the previous October by only about 3 per cent; and the turnover in clothing, which is an indicator of special importance in this connection, was actually somewhat less than a year earlier.

In order to present this state of affairs in the proper light it is of course constantly necessary to emphasise that, apart from the continued growth in the formation of savings, it is mainly due to shifts in consumption which cause retail turnover and therefore the output of the socalled consumer goods industries to rise less than would correspond to the general economic trend and in particular to the increase in total consumption. Further details were given in the last Monthly Report, where it was in particular pointed out that as a result of the shifts just mentioned in the expenditure on consumption a substantial part of consumer demand is nowadays being directed to goods which are produced not by the traditional consumer goods industries but by the capital goods industries, such for instance as radio sets or motor scooters. There is however a further fact which is important in this connection, namely that the brisk activity in building during recent years has enabled a large part of the population to move once again into dwellings which are more suitable, although in many cases also dearer, than those which they had during the first few years after the Currency Reform. At all events despite the fact that all pre-Currency Reform rents have been kept completely stable since 1952 the proportion of expenditure on rents to total consumer expenditure is rising slightly, the more so because many householders, bent on improving their standard of housing, are quite willing to accept the higher

costs entailed through dwellings which have been financed without any public assistance, or have been built only in part with public support. It is no doubt also for this reason that the proportion of the increase in incomes which is being spent on consumption of the traditional consumer goods is no longer so high as in the first years after the Currency Reform. That is why the course of activity in what are called the consumer goods industries is no longer so good an indicator of the extent of consumption as it used to be. Apart from this however the general economic trend does not at the moment require any greater support from consumption. The growth in capital investment described above rather shows that the state of activity is at present relatively independent of consumption, this being because the considerable and largely self-supporting propensity to engage in capital projects is at the moment providing sufficient stimulus.

But the greater the tendency for employment to increase as a result of this factor, the more guarantee there is that output in the traditional consumer goods industries will continue to grow at least at the same rate as up till now, and that indeed within the near future it may perhaps begin to be affected by a stronger demand. In fact as is shown in more detail in the following Chapter (see in particular the Table on page 32), the income of the masses has for some time been again rising with comparative vigour under the double influence of the upward trend in employment and the wage increases; and it is quite possible that this income in its upward course may also draw up after it, with a certain timelag but more than it has hitherto done, the production of consumer goods.

Building at the end of this Year's Season

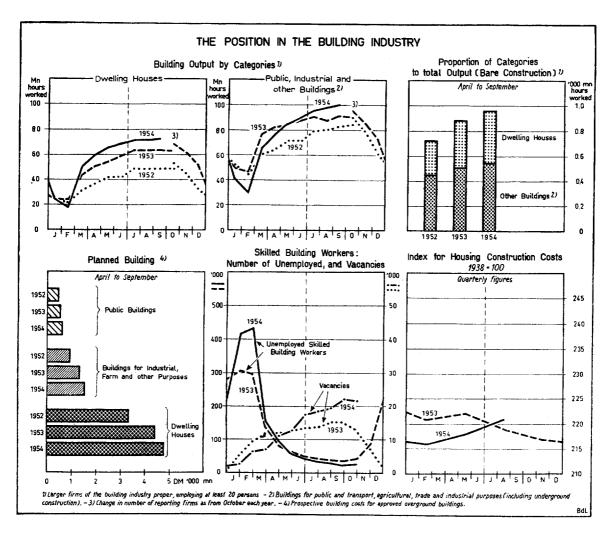

During the period under report the activity in building reached and passed its seasonal peak. Even in October, according to the building index of the Federal Statistical Office, the amount of labour used in producing bare shells of buildings was already slightly less than in September; and in November the usual seasonal contraction would seem to have started in the other branches of building as well. The amount of unfinished buildings is however very large; and it is therefore highly probable that, if the weather makes

it at all possible, interior finishing work will by itself keep building activity at a relatively high level even during the winter.

So far as can be seen up till now, this year's building output will substantially exceed that of last year in spite of the fact that the start of work this season was much delayed because wintry weather persisted for so long. According to calculations by people in the trade the overall volume of building done in the first three quarters of this year was greater by 7.5 per cent than in the corresponding period of last year. By the end of the year this difference is certain to become greater still because, as already mentioned, in the season which is just finishing many projects could not be started until comparatively late. At all events in October the building index of the Federal Statistical Office was still higher by 10 per cent than in the corresponding month of 1953. In particular the output of dwelling-houses

was again substantial. From January to the end of September, the last date for which statistics are to hand, 240,155 dwellings were completed and passed. This was nearly 16 per cent more than in the corresponding period of the previous year. The passing of new dwellings is moreover mainly concentrated in the last quarter of the year, the number taken over in the last quarter of 1953 having been 258,719 as against 207,290 in the previous three quarters of that year. It can therefore be taken as certain that the number of new dwellings built this year will be at least 550,000. This would bring the total number of dwellings built since the beginning of 1949 up to about 2.5 million, while it would raise the total number of dwellings in existence to 11.5 million as compared with 9.0 million at the end of 1948.

It is however true that in the course of the season this large volume of building activity has

caused shortages to appear in many of the building trades, with the market reactions which these inevitably entail. Difficulties have for instance occurred here and there in the supply of building materials such as roofing tiles, wall and flooring slabs, artificial stone and in some cases also structural steel. These difficulties were not entirely prevented even by the fact that in many cases productive capacity still remained unengaged in other regions, the reason being that the costs of transporting building materials are relatively high, so that the process of equalising supplies as between the different regions was able to operate only partially, and as a rule only at the cost to some extent of price rises. In fact, as will be shown in more detail in the Chapter on Prices and Wages, there were a number of cases in which the prices of building materials rose. This happened particularly in the case of timber. where the greatly enlarged demand encountered a practically inelastic supply. Similarly, in spite of having been much enlarged during the last few years, the supply of machinery and equipment in the building trade was not great enough to meet the peak demands at the height of the season. This was felt all the more keenly because during the present season the gradual exhaustion of the teserves of labour has made itself even more apparent than in the previous season. Even by the early summer unemployment in the building trades had declined to a relatively low level; and at the end of September in the whole area of the German Federal Republic, i. e., including those regions that were less affected by the building boom, there were only some 15,000 skilled building workers out of work - and it is moreover likely that some of these were no longer fully employable. There was a particularly marked shortage in bricklayers and bricklayers' labourers: in fact less than 5,000 of these were recorded as being unemployed, as against a number of vacancies more than twice as great. To all intents and purposes indeed disengaged skilled workers were no longer to be found in the chief centres of overground building activity.

A fact which did much to cause these bottlenecks was that this year, in addition to the activity in housing, that in many other forms of building was also much better than had been originally expected. When the Federal Government decided about a year ago to enlarge the housing programme, which at its then level was already of great size, many people supposed that this enlargement would in great measure only fill the gap which seemed to be appearing in other branches of building activity. The position was indeed that from the middle of 1952 to the middle of 1953 not only building on public account but still more that for industry and commerce was showing signs of a certain flagging, these being usually interpreted as indications that capital expenditure on private account was continuing at a much slower rate. That is why it actually seemed appropriate to offset by increased housing activity any decreases in the number of building orders which might have to be expected in these fields. Since then however it has been found that this expectation was incorrect. In fact, during the second half of the past year capital expenditure on private account has also shown a new and vigorous upswing: this for example is reflected in the fact that the amount of building for purposes of trade and industry is again growing considerably, while as matters stand the present underlying tendency is probably for it to increase further. So far therefore from the amount of industrial and commercial building leaving capacity available for a further increase in housing activity, it has to some extent competed against that increase; and this combination of causes has inevitably led in many respects to strains of the kind just mentioned. No doubt there would have been even more instances of friction had it not been for the fact - also largely unexpected - that building activity on public account continued to be restricted this year owing to the fact that certain capital projects planned by the occupying powers were for the time being not carried out, or not fully carried out, while at the same time certain capital projects in connection with transport and communications had to be further postponed for the time being.

In any event the strains which have appeared in the course of this year's building season make it clear that in connection with the further execution of public building programmes, including those projects which are supported with public resources, more regard will have to be paid to the capacity of the building industry. For data for previous months and for explanatory remarks see the Tables under XIII (Production, Employment, Turnover and Prices) in the Statistical Section of this Report.

1) Including extra shifts. — 2) Position as at end of month or quarter. — 3) Excluding all semi-finished goods, broad strip and steel tubes, including primary products; as from January 1953, including semi-finished goods for tube works. — 4) Only larger firms of the building industry proper. — 3) As from October 1953, changed number of firms covered: firms now employing 20 or more persons have been newly included; firms where the number of employees decreased to less than 20 have been eliminated. — 6) Average of the end-of-month figures of the respective quarter. — p) Provisional figures. — Differences in the totals due to rounding off of figures.

itself, it is true, that capacity is steadily growing; and the slight bottlenecks which have here and there occurred this year will no doubt contribute towards the devoting of even greater effort than hitherto to the task of increasing the efficiency of the building industry, and in particular to more use being made of building methods which economise labour. On the other hand however it is probable not only that the demands made by private enterprise on the building industry will grow, but that the public authorities will in addition impose further substantial tasks on it within the near future - in particular in connection with the building of roads, with other capital projects connected with communications, and with the building works required for purposes of armament. As yet it is scarcely possible to foresee the dates when these things will occur, so that it is quite possible that even during the next building season no substantial increase in public building activity in the narrower sense of that term will yet be perceptible. At the same time however allowance will sooner or later have to be made for these forthcoming tasks, and the remaining programmes financed out of public resources will have to be adjusted to accord with them.

The Position on the Labour Market

Like the activity in building, employment also reached and presumably passed its seasonal peak during the period under report. While it is true that the number of persons registered as out of work does not precisely reflect the extent of employment because new would-be earners are constantly finding work, that number did decline in October by only a few thousand; and in November it probably already showed a slight rise, because in that month the effect of dismissals in farming, the hotel and tourist trades and other markedly seasonal callings was probably reinforced by appreciable reductions of building activity. It is therefore likely that unemployment reached its seasonal low point for this year in October at around 820,000. This was lower by fully 140,000 than at the corresponding date a year earlier, although it must be borne in mind that last year the number of unemployed at the end of October was already above that at the end of September by more than 20,000. This year's October figure was actually more than 200,000 below the seasonal low point of 1,028,000 for 1952; and it is significant that this decrease, just like that in comparison with the figure of a year ago, took place almost entirely in the number of men registered as out of work.

Certainly a figure of something over 820,000 persons without work at the seasonal peak of employment remains considerable; and it does so all the more because it seems in some measure to be in contradiction with the shortage of labour which prevails in certain quarters. The picture does however alter when one realises that in the German Federal Republic every person who applies to the Labour Exchanges for assistance in finding employment, and who does not immediately succeed in obtaining a job, is recorded as being out of work. Besides this one must bear in mind that a comparatively large percentage of the persons recorded as being unemployed are not fully employable, while the distribution of the unemployed as between different regions continues to show great divergences. This regional divergence in the extent of unemployment is of special interest in the present connection. It still results in the main from the great influx of population which the German Federal Republic was obliged to receive during the first few years after the war from the German territories in the East, and even from some Eastern regions outside Germany. At that time room had to be found in the German Federal Republic for about 7 to 8 million refugees and expelled persons within a very short space of time. Since moreover the war had already caused the amount of available housing space in the industrial districts to contract to a minimum, there remained no other course except for the time being to find accommodation for those millions of people in regions which were mainly agricultural and often remote. In those regions the people concerned had only slight prospects of finding work. During the last few years a great deal has of course been done towards remedying that situation. Many of the people who had been at the outset accommodated only from the point of view of finding them a home were resettled; and some of the rest eventually succeeded after all in establishing a livelihood in the area in which they first took refuge - the more so since the refugees themselves achieved astonishing success in the creation of new industries, or in the transplanting of activities from their homelands into the territory of the German Federal Republic. But there has still remained a substantial residue of "refugee unemployment". At the end of October for instance out of \$20,000 registered unemployed there were still 434,000 located in the "old refugee Lands" of Bavaria, Lower Saxony and Schleswig-Holstein, in spite of the fact that these Lands account for only about 34 per cent of the wage and salary earning labour force. On the other hand in the main centres of industry such as North Rhine-Westphalia and Baden-Württemberg, which account for 46 per cent of the wage and salary earning labour force, only 201,000 unemployed were recorded. Accordingly the "proportion of persons not engaged in gainful activity" in these last-named Lands is substantially below the average for the entire German Federal Republic, especially as regards men. In North Rhine-Westphalia for instance at the end of October only some 2 per cent of the men in the labour force were out of work, and in Baden-Württemberg only 1.6 per cent. Yet, apart from the personal impediments which can

never be entirely eliminated, any migration much greater than at present to these areas from those with a higher unemployment ratio is still being obstructed by the lack of housing accommodation, great as is the progress which is being made in this respect.

A further point which is of great importance for any assessment of the residue of trend unemployment is the question of how far the people concerned are employable. A comparatively high proportion of the unemployed recorded at the end of October, namely 366,000 out of the total of 820,000, were women, and about a quarter of these were unskilled workers. This results mainly from the fact that, out of the total of nearly 680,000 persons who were recorded by the Labour Exchanges during the four years from September 1950 to September 1954 as new recruits to the labour force (and this does not include the young people who had just left school or the new immigrants into the area of the German Federal Republic), nearly 500,000 were women, this being because the proportion of women engaged in or seeking gainful activity is markedly rising. Not all of the people just mentioned were immediately suitable for a job; but in accordance with the regulations the Labour Exchanges register them as being unemployed so long as no job can be found for them. Other impediments to the finding of employment have arisen from the age and the state of health of the unemployed. At the end of August 1954 for example, according to the latest statistics collected on this point, nearly two-fifths of the registered unemployed were more than 45 years old. Of the unemployed men indeed roughly a half had passed that age. No other criteria for judging employability are available as regards the recent past. But in 1952, out of the persons then registered as being out of work, some 40 per cent were officially described as being scarcely employable or employable only to a limited extent.

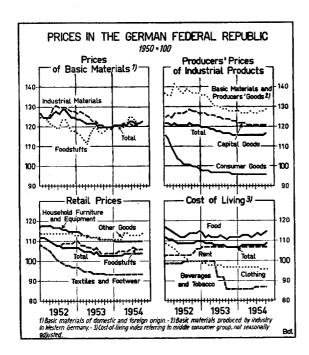

For the most varied reasons therefore the unemployed, the number of whom is in many respects still substantial, were available only in greatly limited degree for the purpose of remedying the shortage of labour which has already appeared in a number of quarters. It is however certain that, to the extent to which the labour supply as a factor in production becomes shorter, the reservoir represented by such unemployment as still exists will be further drained. That must be expected all the more since the stream of new recruits to the labour force, which during the last six years has after all added 3.4 million to its number, is likely to grow smaller during the next few years. This is not only because the number

of young people reaching employable age will decline as from next year, but also because the proportion of the employable population who are engaged in or seeking gainful activity is growing only at a slower rate than before, and it is not certain whether the immigration into Western Germany of new recruits to the labour force will offset these shortfalls.

Prices and Wages

Prices

Recently the vigorous upswing in economic activity has been producing somewhat more effect on the course of prices than before. So far however price increases are still apparent in exceptional cases only; in fact, in many branches of activity, and especially in those where it has been possible to lower production costs by dint of the considerable capital expenditure on rationalisation during recent years, prices even continue to be under a certain downward pressure. Consequently as can be seen from the graph the index of producers' prices of industrial products, which probably best represents the movement in prices due purely to domestic causes, has not yet exceeded the low point it reached about a year ago. It is fully 4 per cent below its highest point to date, reached in 1952.

This stability is the more remarkable inasmuch as industrial production has risen since 1952 by about 30 per cent, one-third of this rise having taken place during the last twelve months alone.

Still, in some individual trades of late the tendency of prices has become somewhat firmer. Some part in this movement has been played by higher prices for certain imported raw materials as well as by higher wages, since it was not in all cases possible to absorb the effect of such factors either in the profit margin or through measures of rationalisation. But higher costs have not in every case been the cause determining the price rises which have occasionally appeared; and no doubt even in the cases where they did cause price rises they could not have produced that effect nearly so easily if they had not been assisted by the growth in demand. In fact, as a result of the present situation with regard to production, it has in certain trades no longer been possible to adapt the supplies to the growing demand and thereby to prevent strains in the markets such as may tend to force prices up.

One group of markets in which such influences are at work comprises those for a number of foodstuffs. In particular the more than seasonal rise in the price of butter during the period under report has attracted attention. It is explained by the fact that on the one hand consumption has again increased somewhat more in the course of this year owing to the favourable movement in incomes, while on the other hand the output of butter during recent months has been only slightly greater than a year before and has at times been actually smaller than then. One factor in producing this result has been the difficulty in putting cattle out to pasture,

¹⁾ For data for previous months and for explanatory remarks, see Table XIII, 6 (Price Indices) in the Statistical Section of this Report. — ²⁾ "Volkswirt" index, calculated by R. Schulze. — ³⁾ Farm year 1949/50 = 100. — p) Provisional.

coupled with the limitation of fodder supplies, due to the bad weather; but there is the further fact that for some time now the number of milch cows has been about stationary. The deliveries from stock also remained for a time small, more especially because the level of stocks in September was only about the same as a year previously owing to the smaller imports during the late summer. Recently however greater quantities have been imported, so that there is every prospect that in the future the supply will better conform to demand.

So far as price rises occurred among the remaining foodstuffs during the period under report, most of these were admittedly due to seasonal factors. This especially applies to meat prices, and more particularly to those for hogs, which were rising until October but have since been declining in accordance with the usual

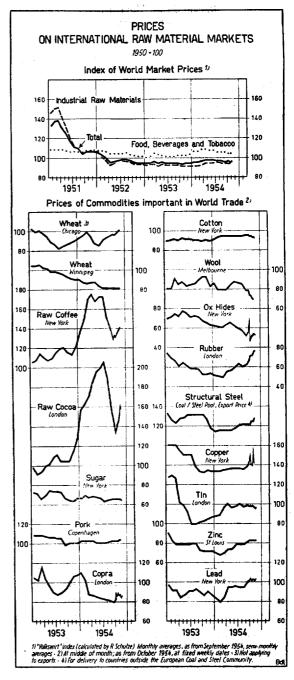

seasonal trend. On the basis of the present market tendency it may indeed be expected that the fall in hog prices this winter will be somewhat greater than is usual at that season, because owing to the "hog cycle" which still operates to a certain extent there is likely in the immediate future to be a relatively large supply of hogs for slaughtering. Fruit and vegetable prices too, after their comparatively large rise in the summer and early autumn, have recently again been characterised by seasonal weakness. However, vegetable prices are still well above their level of a year ago, because the area sown to vegetables this year was considerably cut down owing to the very low prices prevailing at the time, resulting in a considerable decline in supplies. Similarly the prices for coffee, cocoa and cocoa products have been brought down again in line with the fall in world market prices, although in accordance with the movement in these latter the previous price level has not in all cases been again reached. Thus, if one looks at individual prices in the foodstuffs category, one finds that among these also there are highly divergent tendencies. The fact that some prices have declined or remained unaltered certainly provides consumers with the opportunity to escape the effect of individual price increases through their selection of what they consume.

A second market in which various prices have for some time been tending upwards is that for building materials. Among these in fact the lively activity in building this year gave rise to a number of bottlenecks, which did not fail to affect the market situation. This applies in particular to round and sawn timber, bricks and roofing tiles, but also to sundry household fittings such as electric wiring, sanitary pottery and the like. The timber market became especially strained. While the demand has greatly risen, production within the country cannot be immediately increased. Indeed, in order to avoid excessive exploitation the forestry authorities actually to some extent reduced the number of trees felled this year, although the reduced number still remains above the normal felling target. Even the increased imports have not so far closed this gap, because round timber of those types which are at present particularly

scarce is hardly being supplied by foreign countries at all. In the case of the other kinds of timber the larger imports have actually strengthened the upward trend of prices on the West German timber market, since the price level abroad is in general higher than that in Western Germany. Recently in fact the rise in timber prices has extended its effects to cover not only the building trade but also other industries, in particular those producing pulp, paper and furniture. Thus it has recently been announced, after the prices for some kinds of paper had already been raised, that those for pulp are also to be put up. It is true that this movement is due not only to the rise in prices for timber, but also in part to the fact that the paper and pulp industry has been more and more approaching the limit of its capacity, so that it is becoming more difficult, also from the point of view of the elasticity of its power to supply, to meet the rising demand.

There is also evidence of some movement in prices in the ironworking industry. It is true that there has still been no actual increase in West German prices for iron and steel, only the prices fixed within the European Coal and Steel Community for the export of rolled steel products to outside countries having been recently raised; but on the other hand all the rebates which were introduced at the beginning of this year, when activity was still comparatively low, have been cancelled again in the course of the past two months.

Finally there have been rises in the price of a number of imported raw materials for industry, the reason being that on the world markets in question the basic tendency has at least for the moment again become somewhat firmer owing to the fact that in many of those markets too the demand is now a good deal keener than it was. This applies in particular to rubber and non-ferrous metals. In general however it cannot be said that any appreciable influence tending to raise prices is at present coming from the international raw material markets. On the contrary, important international price indices, such as Moody's Index and the "Volkswirt" Index, have further declined since August in spite of the fact that an opposite tendency prevailed at times on the markets for non-ferrous metals

and for rubber. Indeed on many of the international markets for raw materials, especially on those for raw materials produced by agricultural methods, any substantial upward movement in prices is being hindered by the large supplies carried over from earlier years. The depressive effect of these can be clearly felt even in cases where this year's crops were comparatively poor, with the result that the recent tendency has been somewhat firmer than before, as for instance in the case of wheat and

cotton. As to important kinds of vegetable oils and fats, hides, skins and wool, the world market prices for these have of late actually been again relatively weak. The prices of coffee and cocoa have also declined further; and in their cases, especially in that of cocoa, it was not until recently that the tendency once more became somewhat firmer.

Among the West German prices which have further declined during recent months as a result of the measures of rationalisation that have already been mentioned, one may quote in particular those of certain durable consumer goods such as passenger cars, refrigerators and radio sets. Certain price concessions have also been made in the footwear industry, as well as in some branches of the textile and clothing industries, especially since as already pointed out the growth in demand in their case has not been nearly so great as in other lines. On the whole therefore the movement in prices continues to be much more characterised by divergent individual movements than by any general tendency to rise. This however should not distract attention from the fact that in certain markets strains have arisen; and these strains ought not to be further intensified but rather alleviated, so far as this can be done by the taking of special measures, such for instance as a certain limiting of the expansion in housebuilding.

The Movement in Wages and the Income of the Masses

Wages during the last two months have continued to follow a normal course. In a number of branches of activity which is actually not small further wage increases have occurred. In September there were also rises in the scales of remuneration for workers and employees engaged in the public service, other than those employed by the Federal Government, Railways and Postal Administration. But all these increases were brought about through amicable agreement; and, like those which preceded them, they seem in general to have been kept within justifiable limits. True, it will not be possible to say anything more precise about their extent until the November quarterly figures of industrial workers' wages are available, since these provide accurate statistical material in regard to the wages of at least the greater part of all employed persons.

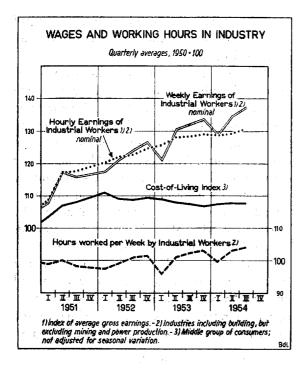

The August statistics in this series were published during the period under report, and have been summarised in the usual compressed form in the table below. They confirm that up till August the rises in wages must have been relatively small. At all events in that month the average hourly earnings of workers in industry were only 1.9 per cent higher than at the corresponding date a year earlier, although by comparison with May this year, the previous month for which statistics were collected, there was a rise of as much as about 1 per cent, this percentage representing the average for all industrial workers. In all probability the corresponding ratios of increase according to the November statistics will be substantially greater.

Source for Columns 1 to 4: Federal Statistical Office. — 1) Including building, but excluding mining and power production. — ³) Gross weekly and hourly earnings divided by the cost-of-living index for the middle group of consumers, not adjusted for seasonal variation. — ³) Calculated from index figures.

As regards the rise in average weekly earnings however, as early as August it substantially exceeded that in the hourly earnings. In fact the average weekly earnings in August, at nearly DM 82, were already 2 per cent greater than in May this year, and 3.9 per cent greater than in

August 1953. This was because the average number of hours worked per week has shown a considerable further increase in the course of this summer. In August last year the number was 48.6, whereas this year it was 48.5 in May and 49.0 in August. This clearly shows the considerable strain which is being placed on the reserves of labour as well as the continuance of a strong will to work on the part of the population. The people in general are in fact still glad to work overtime, because this enables them to improve their standard of living, which on the whole still shows vestiges of the losses suffered owing to the war. Since, as already stated, the overall cost of living has scarcely risen, almost the whole of the rise in gross weekly earnings has gone towards expanding the purchasing power of the population. The result has been that in terms of real value the average gross weekly earnings of industrial workers had risen by August this year to 126 per cent of what they were in 1938.

Total wages and salaries are effected not only by the above-mentioned rise in wage rates and by the amount of overtime worked, but also by the increase in the number of persons employed. According to our provisional calculations the gross income from wages and salaries in the third quarter of this year amounted to DM

16,600 million. At this figure it was greater by DM 800 million or 5 per cent than in the previous quarter, and was greater by DM 1,300 million or 8.6 per cent than in the third quarter of 1953. It is true that the increase in the net income from wages and salaries was not quite so large, because owing to the progressive effect of the tax scale the deductions on account of taxes and social insurance contributions increased somewhat more than gross wages and salaries did. Even so, the increase as compared with the third quarter of 1953 was as much as DM 1,100 million, or 8.4 per cent. There was also a rise during the third quarter of 1954 in the amount of public assistance pensions and benefit payments out of public funds, which together with the income from wages and salaries constitute what is called the income of the masses, this rise being mainly due to the increase in the amounts paid out by the Equalisation of Burdens Fund as Currency Conversion Compensation for Expelled Persons and in

respect of Household Equipment Assistance. Further details on this point can be seen from the table. The result was that according to provisional calculation the income of the masses to omer to attrige, only solor an leading decimals

in the third quarter of this year reached DM 18,700 million, thereby exceeding by almost 9 per cent what it was in the corresponding quarter of last year.

the contradiction becomes a more than the contradiction

into contragatos de encolaración est Foreign Trade and the Balance of Payments inds adoption of mile

-org bus universe Foreign Trade (2001) difficult

with the more about this state that the control of

In the foreign trade figures which have become available during the period under report, namely those for October 1954, the particularly remarkable feature is that apart from further expansion in imports the figure for exports has also again tisen. The total value of exports in October is stated as DM 1,982 million. By comparison with the two previous months, in each of which the amount was about DM 1,840 million, this represents an increase of some 8 per cent; and as compared with the average for the whole third quarter of this year, in which the July exports were relatively large, the increase is 6 per cent. If compared with October 1953 the exports were higher by nearly DM 260 million, or around 15 per cent.

The further prospects also appear to be not unfavourable. At all events the amount of foreign orders placed in September, the last month for which data are available, again showed a considerable rise as already stated, so that their total for the third quarter of this year was greater by about a third than in the corresponding period of last year. In this connection Western Germany is no doubt being assisted by the fact that international trade, which had appreciably declined between the beginning of 1951 and mid-1953, has in the meantime recovered and of late-has actually shown signs of a certain revival. In any event it is worth remarking that neither this year nor in the preceding years has the improvement in exports been achieved at the cost of the other countries, which are great exporters of industrial products. On the contrary, exports have risen in most of the other industrial countries in Western Europe and in the United States of America, although in every case they have done sonto a smaller extent than in the German Federal Republicalt must be borne in mind that the latter, in spite of considerable

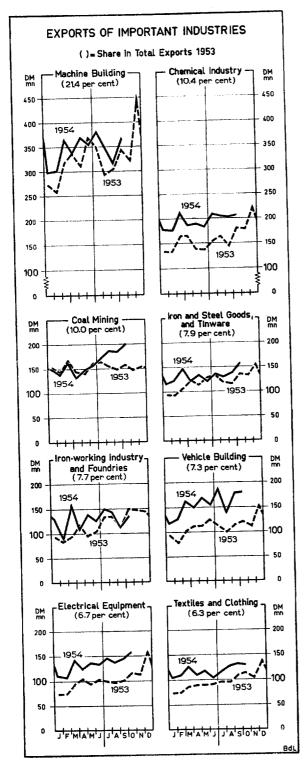

export successes during recent years, has not yet regained its pre-war share of world trade.

The following table and graph present a view of the extent to which individual industries have

Industrial Exports by Groups of Industries

contributed towards the increase in Western Germany's exports in the course of this year so far. They show that by far the greatest absolute contribution came from the capital goods industries, as indeed had to be expected in view of the structure of German exports. By comparison with

the previous year the relative increase was especially great in the case of ships, motor vehicles and electrical equipment. Another important factor was the rise of about 22 per cent in chemical exports. The exports of some of the consumer goods industries were however also greatly increased. Those of the textile, glass and pottery industries for instance were up by about one-fifth, those of leather production and processing by about one-third, and those of the woodworking and wood processing industry by as much as nearly one half by comparison with the previous year. However, in view of the fact that the proportion of exports to the total sales of the consumer goods industries is still relatively low, too much importance should not be attached to these rates of increase.

In October, as already mentioned, the rising tendency which has for some time been apparent in imports continued. They reached a new peak of DM 1,848 million, thereby exceeding their total for October of last year by DM 417 million or 29 per cent. The increase of roughly DM 134 million as compared with the previous month took place mainly in the group of foodstuffs. beverages and tobacco, especially in grain, oilseeds, vegetable oils and fats, fruits of southern origin and so forth, and would therefore seem to have been largely seasonal. There is however no mistaking the fact that some influence is also being exerted by factors connected with economic trends, such as the growth in consumption within the country and the efforts which are being made gradually to replenish stocks of goods. A characteristic indication of this is for instance the fact that in the case of industrial imports, in addition to raw materials, it is especially those of finished goods which have risen, so that their proportion to total imports is now about 17 per cent as against approximately 15.5 per cent in

Both for seasonal reasons and in the light of the economic trend it must be expected that imports will continue to grow at least for the rest of this year. A fact which may perhaps contribute to this growth is that recently, in accordance with the announcement made some time ago, the liberalisation of imports from the Dollar Area was carried further. The new free list which came into force on 9 November 1954

contains roughly 3,600 out of the 6,000 items in the list of goods as officially classified for statistical purposes; this compares with some 1,800 items in the first list, which had been in effect since 17 February this year. The effect is that in terms of the 1952 imports some two-

thirds of those from the dollar countries have now been liberalised. The additional liberalisation applies mainly to industrial semi-finished and finished goods. Besides this the procedure for liberalised dollar imports was simplified at the same time as the new free list for dollar imports came into force. In particular for instance the previous regulation was cancelled according to which the country producing the imported goods and the country selling them had to be identical. Therefore the goods named in the free list can now also be imported by way of non-dollar countries. It is however unlikely that any great use will be made of this facility, because importers are now able to import such goods direct, and this method is as a rule cheaper. Moreover, the dollar goods previously imported through third countries did not mainly consist of goods obtained from the dollar countries proper, but came chiefly from the other non-agreement countries, to which as will be remembered the liberalisation list does not apply. In fact less than a half of all the dollar goods imported so far through third countries came from actual dollar countries, whereas goods originating from these latter accounted for some 83 per cent of the total imports from the non-agreement countries.

The export surplus of DM 134 million in October was practically unchanged as compared with that in September. Since the beginning of the year it now amounts to not quite DM 2,400 million on foreign trade as a whole, and to something over DM 2,600 million on the "commercial" foreign trade, in which the imports financed by foreign aid are disregarded. The export surplus for the whole of 1953 was DM 2,500 million, or DM 2,800 million on the "commercial" trade alone.

Payment Transactions with Foreign Countries

The Overall Position

During the period under report the payment surpluses with foreign countries were once again small by comparison with what they previously were. In October they amounted to \$ 14 million; and in November, so far as the position can yet be judged, they are hardly likely to be much bigger. Their monthly average for the first quarter of 1954 on the other hand was \$ 75 million.

while that for the second and third quarters (without allowance for the payment to the International Monetary Fund) was \$ 55 million, and the September surplus was \$ 24 million.

Reference has already been made in previous Monthly Reports to the main causes of this state of affairs, namely the quite considerable decrease in the favourable balance of transactions in goods and services, and the continuing net deficits on capital payments and the service of capital. In October however the payments surplus was further depressed by the fact that in that month under the Reparations Agreement with Israel payment was made for oil taken by that country to the extent of \pounds 3.2 million in sterling, or \$ 8.9 million if converted into U.S. currency. This payment, which had been preceded by a number of similar payments, was made to Great Britain; and it was one of the chief reasons why the German payments surplus on E.P.U. transactions was especially small in October. The effect was to bring the total payments so far made by the German Federal Republic in respect of Israel's oil imports up to £ 19.1 million or \$ 53.5 million. In addition between July 1953 and the end of October 1954 the German Federal Republic delivered German goods to Israel by way of reparations without payment to a value of \$ 49.1 million, mainly comprising rolling mill products, machinery, electrical equipment, hardware and fertilisers.

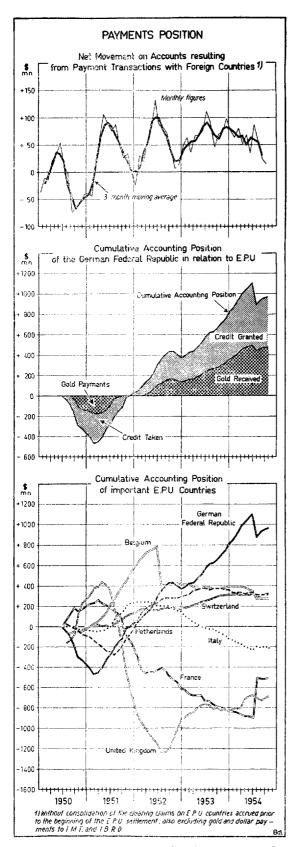

Among the foreign exchange outgoings in respect of capital transactions and transfer of the income on capital during October, no more recent figures being yet available, the first place was again taken by transfers from Liberalised Capital Accounts. Such transfers amounted to about \$ 18 million. One of the chief remaining factors causing withdrawals from Liberalised Capital Accounts was the purchases of West German securities, which increased in amount as compared with the previous months. It is true that, as against these withdrawals, there continued to be in-payments arising from the sale of West German securities, while the Liberalised Capital Accounts were further replenished not only by transfers from the blocked time deposits and monies at notice which became free, but also through individual restitution payments and other payments in favour of foreigners. Accordingly in

October the total amount of balances on Liberalised Capital Accounts, including the small amount of blocked DM still existing in the form of unmatured time deposits and monies at notice, declined by only DM 64 million or \$ 15 million, and still amounted at the end of that month to something over DM 500 million.

Payment Transactions classified by Currency Areas

If one looks at the payments according to currency areas one finds that the payments surplus in relation to the E.P.U. Area has remained at a comparatively low level. The total surplus with E.P.U. countries in October amounted to \$ 14 million as against \$ 12 million in the previous month and a monthly average of \$ 29 million for the third quarter. The above-mentioned payment of not quite \$ 9 million for oil taken by Israel is not however included in this reckoning, because on classification of the payments by groups of countries it is an adverse item in the transactions with the group of countries without clearing agreements to which Israel belongs, although from the foreign exchange point of view the payment was made by the debit of our currency balances with the E.P.U. Area. This charge is one of the reasons for the already mentioned fact that in October our accounting surplus with E.P.U., which for the reasons frequently described in these Reports is never or is only by chance identical with our total payments surplus in relation to E.P.U. countries, amounted to only 11 million units of account and thereby reached its lowest level since the beginning of 1953. But for this payment it would have been about \$ 20 million, as in the previous month.

After the October settlement the cumulative accounting position with E.P.U. amounted to 969 million units of account. The effect, as the graph on page 37 shows, is that on the cumulative position the German Federal Republic remains the greatest creditor of E.P.U. It is followed after a considerable interval by Switzerland, the Netherlands and Belgium, although it is true that since the recent E.P.U. arrangement the cumulative accounting positions of the various creditor and debtor countries have come somewhat nearer to each other. But since this

new arrangement was made for the E.P.U. settlement, with effect from 1 July of this year, the

cumulative accounting position has been affected not only by the current foreign exchange payments through E.P.U. accounts, but also by the bilateral instalment payments made under the agreements on consolidation of part of the balances existing on 30 June this year. Payment transactions through E.P.U. accounts from July to October this year produced a surplus of 109.3 million units of account for the German Federal Republic, whereas owing to the payments to amortise our old E.P.U. credit balances the increase in the cumulative accounting position over the same period was only 55.3 million such units. The E.P.U. has also to a corresponding extent paid more gold to the German Federal Republic than would result from the increasing of the gold portion in the cumulative accounting position. Thus during the period from July to October 1954 the German Federal Republic received from E.P.U. gold payments to a total of 54.6 million units of account, representing half the country's accounting surpluses in relation to E.P.U. during the period, whereas during the same period the "gold portion" in Western Germany's cumulative accounting position increased by only 27.6 million units of account.

The payments surplus in relation to countries with which payment transactions are not settled through a clearing agreement, which group mainly comprises the dollar countries, was again very small in October. It amounted to only \$ 11 million, as compared with \$ 16 million in September and an average of \$ 39 million for July and August, although it is true that the monthly average for the first half of this year was also only \$ 12 million. The decrease is mainly due to the payment in favour of Israel which has already been mentioned. True, the position was also to some extent affected by the circumstance that of late our balance of payments with this group of countries has been under a somewhat heavy charge due to the fact that the present rise in imports from the Dollar Area largely equals, if indeed it has not exceeded, that which has taken place in exports to the dollar countries since the beginning of this year. In a certain measure this movement is no doubt seasonal. It remains however to be seen whether the recent extension of the liberalising of dollar imports may not also produce a similar effect. In that

For data for previous months and for explanatory remarks see Tables under XII (Foreign Trade and Payments) in the Statistical Section of this Monthly Report.

1) Imports according to selling countries; exports according to buying countries. — 2) Excluding countries not ascertained. — 3) Net balances of all payments in respect of goods, services, capital movements and unrequited remittances in relation to a currency area, regardless of the currency paid. — 4) Payments not recorded under capital movements, capital yields or unrequited remittances. — 5) Regarding ascertainment of the German Federal Republic's cumulative accounting position since 1 July 1954, cf. the Monthly Report of the Bank deutscher Länder for July 1954, p. 26 et seq. — 8) Including balances in Canadian 8. — p) Partly provisional figures.

case, as has indeed been normal during recent years, the achievement of further surpluses with this currency area would depend entirely on the receipts of dollars in respect of the exchange of that currency into DM for American agencies in Germany. In October such receipts amounted to not quite \$ 15 million, as compared with a monthly average of about \$ 18 million in the first nine months of this year.

On the other hand in October, as has now been the case for some time past, there was once again an adverse balance on payment transactions with the bilateral offset account countries. In fact in that month the adverse balance with this group of countries actually returned to a relatively high level, at around \$ 11 million; and for November, to judge by the course of payments to date, there is reason to expect a further deficit, even though it may perhaps not be quite so large as in October. The result was that the Bank deutscher Länder's bilateral offset account balances further declined. They amounted at the end of October to \$ 138 million as compared with \$ 153 million on 30 September 1954; and by 26 November they had further decreased to \$ 129 million. By comparison with their peak in September 1953 they have thus been reduced by some \$ 100 million. A particularly noteworthy feature of the recent position has been the further running down of the clearing claims on Brazil. On 26 November this year these amounted to \$ 21 million, being thus above the originally agreed swing by only \$ 7.5 million, as compared with \$ 82 million at their peak in April 1953. This rapid return towards normal, which has been taking place while the volume of trade between Western Germany and Brazil has remained about the same since the end of last year, and which has been largely due to the purchase of Brazilian goods for the purpose of their re-export with Brazilian consent, has recently been affecting the quotation for the free Brazil dollar. This, after having been almost constantly between DM 3.83 and DM 3.89 on the Frankfurt market for more than a year, has risen appreciably since September. At the end of November it stood at DM 4.03 (sellers). In the course of the discussions on payments which were recently held between Western Germany and Brazil it was agreed that the arrangements for payments which

were made between the two countries in 19521), after the swing had at that time been considerably exceeded, shall be retained in force until 9 May 1955. This will be done even if in the meantime the outstanding balance should be brought back to or even below the limit of \$ 13.5 million that was agreed for the swing in the previous payments agreement. As regards the period after 9 May 1955 however a fresh payments agreement is to be made in the course of further negotiations. The clearing debt of Argentina towards Western Germany was also reduced during the period under report, having declined from \$ 39 million on 30 September to \$ 36 million at the end of October, and to \$ 32 million on 26 November. Other changes which took place in October in the bilateral offset account balances of the Bank deutscher Länder can be seen in Table XII, 4 in the Statistical Section of this Report.

Further Multilateralisation of Payments

In any assessment of the balance of payments situation in relation to the bilateral offset account countries however allowance must be made for the fact that for some time past the payment transactions with these countries have no longer been effected exclusively in bilateral clearing currencies. For two years now a considerable part of German exports to such countries has been covered by payments in third currencies, mostly U.S. dollars and sterling, whether through transfers effected by the Central Banks in order to clear off excesses over the swings or in the form of direct payments made by the foreign importers. In addition there has for some months past been a further relaxation of the strictly bilateral clearing system inasmuch as the clearing countries have been and are using for payments in third countries the DM Accounts of Limited Convertibility which were established with effect from 1 April 1954. So far, it is true. the total funds held on these accounts have increased only slowly, so that at the end of October they amounted to no more than DM 176 million or \$ 42 million. But the turnover on them does show that much greater use is being made of the facilities for payment transactions with foreign

¹⁾ See in this connection the Monthly Report of the Bank deutscher Länder for December 1952, page 37.

countries which were created through the DM Accounts of Limited Convertibility than one might suppose in the light of the total from time to time standing on those accounts. In fact the total turnover, after having been about DM 255 million in April this year, had risen in October to more than DM 900 million. To some extent of course these transactions represent a further breach in the system of clearing payments, purely bilateral or free only within the group of E.P.U. countries. It is in fact inherent in the nature of the DM Accounts of Limited Convertibility that they multilateralise payment transactions with the clearing area, inasmuch as at least from the point of view of the German exchange control it is left to the holders of these accounts to decide freely in what countries they will use their credit balances. In fact under the German foreign exchange regulations a bilateral offset account country can for example without further formality use for the purpose of imports from an E.P.U. country its DM of limited convertibility which it has acquired through its exports to the German Federal Republic; and in just the same way an E.P.U. country can import goods from a country not belonging to E.P.U. by the debit of its DM accounts.

In point of fact a good deal of use has recently been made of these facilities, so that the position is no longer merely temporarily but permanently that the streams of the payments passing between the German Federal Republic and the clearing countries can diverge from those of the goods and services exchanged within the limits of the individual clearing areas. In particular certain bilateral offset account countries have repeatedly used this newly created facility in order to meet payment liabilities towards third countries that are members of E.P.U. by means of DM of limited convertibility instead of using such DM, as would have been the case if the arrangements were handled on a strictly bilateral basis, to pay for visible or invisible imports from Western Germany or to reduce their clearing debt there. It cannot be said however that this has in any way diminished Germany's possibilities of exporting. In the first place it must be stated that the use of DM of limited convertibility by bilateral offset account countries to pay for purchases from third countries has so far been confined to

amounts which are of only slight importance if measured in relation to the total volume of German trade with the bilateral offset account area. As a rule indeed the use of DM Accounts of Limited Convertibility for purposes other than the obtaining of German goods or services is considered by the bilateral offset account countries only when they have extremely pressing liabilities to make payments in third countries, or if the countries in question can deliver goods or services on more favourable terms than Western Germany can. In view of Western Germany's strong competitive position however the latter now happens only in comparatively rare cases.

Apart from this, the DM of limited convertibility which are at first used elsewhere are not of course permanently lost to German exporters, since the recipients of the resulting payments will sooner or later use the money in Western Germany. Admittedly it is conceivable that the immediate effect may only be to reduce the E.P.U. deficits of the countries concerned; but on a longer view no doubt that too must tend to maintain and to improve the opportunities for Germany to export.

The main point to bear in mind is however that the enlargement of the possibilities for using the DM in international payments is merely the pendant to measures in foreign countries which are directed to a like object; and that Western Germany in its turn receives from the bilateral offset account countries in return for its exports large payments in third currencies, some of which have become possible only as the result of such parallel measures having been taken in other countries, and in particular owing to the existence of transferable sterling. For example, merely in the form of payments from the Central Banks of the bilateral offset account countries to cover excesses over swings the German Federal Republic between January and October this year received U.S. dollars and sterling to a value of \$ 32 million. From the point of view of competition moreover this reverse stream partly arises from the fact, which has already been mentioned, that in many cases, owing to the increased ability of Western Germany to compete, it may have become profitable to import from Western Germany even against harder currencies, once the limits of strictly bilateral payments have been reached.

This development in particular is the more gratifying in that it is a pointer to the growing readiness for convertibility, since it shows that in many cases the maintenance of our exports has become independent of the support afforded by the clearing system.

Further Technical Relaxations in connection with Payments

A number of further technical relaxations were also introduced during the period under report with a view to the gradual multilateralisation of payments. One result is that as from 1 December 1954 payment transactions in both directions between the German Federal Republic and countries with which there is a payments agreement, comprising bilateral offset account countries and E.P.U. countries, may be effected through any payments agreement. Thereby, in the first place, the facilities for the multilateral use of DM which were created by the establishment of the accounts of limited convertibility have been extended so as to apply also to DM agreement accounts. Another consequence of the new arrangement is that payments in foreign currencies may be made and received within the entire group of agreement countries. Accordingly for example a German importer will in future be entitled to pay for imports from one E.P.U. country in the currency of another E.P.U. country directly, that is without the complication of a multilateral exchange deal. Similarly he will be able to pay in E.P.U. currency for purchases from some other offset-account country, or conversely to pay for imports from E.P.U. countries by transferring other clearing currencies. Similarly, the German exporter may also accept payments in third currency without special permit. All this of course presupposes that the countries with which the German Federal Republic trades will for their part permit payments in their currencies outside the payments agreements. Since however this is true in the case of some important currencies, the new measure adopted by the German Federal Republic can be regarded as a further step towards convertibility. Through this simplification of payment transactions the dividing line between E.P.U. countries and the other agreement countries has been removed to an even greater extent than had already been done through

the introduction of the DM of limited convertibility. The result is that for practical purposes of the German Federal Republic's payment transactions with foreign countries there now remains a distinction between only two currency areas, namely the "free" area and that of the agreement countries.

Liquidation of Standstill Credits

A propos of the more recent events in the field of foreign trade and payments it may finally be recorded that an agreement was made on 18 and 19 November 1954 between the German Committee for Standstill Debts and the Bank deutscher Länder on the one hand and representatives of the British, American and Swiss creditors' committees on the other with regard to the Standstill credits remaining after expiry of the German Credit Agreement of 1952.

It will be remembered that these so-called Standstill credits consist of short-term credits granted by foreign banks to German banks and trading or industrial firms, which credits became frozen in 1931 and were first regulated in the Basle Agreement which was concluded in that year. The prolongation or liquidation of these cr dits was from time to time effected through the conclusion of new Credit Agreements. Out of the original total of \$ 1,500 million of shortterm credits approximately \$ 1,360 million had been repaid, by the time when the German Credit Agreement of 1952 which came into force in September 1953 was concluded, through foreign exchange payments, use of the credits for travel purposes, and in other ways.

Consequently the amount subject to the 1952 Credit Agreement was only about \$ 140 million. By far the greater part even of this amount has now been repaid during the past two years. The creditors made use, to the extent of \$ 41 million, of the facility provided through the Bank deutscher Länder for the conversion of old Standstill credits into new reimbursement credits (recommercialisation). A sum of \$ 48 million was liquidated in Deutsche Marks, while \$ 7 million was settled by other methods including offset in account and conversion into medium or long-term debt. It may be expected that yet further amounts will be repaid in the near future, namely some \$ 20 million in respect of old Standstill

liabilities and about \$ 7 million arising from credits recommercialised during the life of the Credit Agreement.

It was therefore possible to confine the talks in London mainly to those cases where liquidation cannot be effected either because of legal obstacles (Regulation 35 under the Conversion Law, and Berlin Old Banks Law; some \$ 12 million), or because of the special circumstances applying.

The arrangements for settling these debts were embodied in the "Protocol of 1954 covering the German Short-term Indebtedness remaining after the Expiry of the German Credit Agreement of 1952".

Since the Standstill is for practical purposes ended, the material content of this Protocol differs substantially from that of the earlier Credit Agreements. No transfer difficulties obstruct repayment of the debts which the Protocol regulates.

Hence there was no longer any reason for the Central Bank, which had participated in every previous Credit Agreement since 1931, to sign it. Instead of this the Bank deutscher Länder gave a declaration that it will at the proper time issue the permits required for the repayment of these credits. In the preamble to the Protocol it is stated that during the life of the German Credit Agreement of 1952 the conditions for financing the foreign trade of the German Federal Republic were normalised through the improvement in the country's foreign exchange position and through the granting of new credits. This statement by the parties to the agreement indicates the decisive change which has occurred in the circumstances of the Standstill.

The Protocol is limited to a period of one year, but its duration can be extended.

The Function of Public Receipts and Expenditure in the Distribution and Appropriation of the National Product

It is characteristic of the economies of modern nations that the public budgets produce a substantial effect on the distribution and the appropriation of the national product. A large part of the national income passes into the hands of the public authorities in the form of taxes, levies and compulsory insurance contributions, being then spent by these authorities for the purposes laid down in their budgets. The disposable private income however is not by any means reduced to the full extent of the compulsory imposts levied by the public authorities. On the contrary, a considerable part of these imposts flows back into the private income stream in the form of public assistance pensions and benefit payments, although it of course goes to groups other than those from whom the imposts were collected. Since the war there has been a great increase everywhere in the importance of these income transfers serving the purpose of equalisation of incomes. But even of the rest of the public receipts only a part serves for governmental consumption in the proper sense of that term. The remaining part is used for financing capital expenditure, or for assisting capital projects, which might otherwise perhaps not be realised or not be realised to the extent which is in the public interest; or it is used to build up necessary reserves, as for instance in the case of the Social Insurance Institutions, or to set funds aside in order to cover expenditure which may be expected to arise in the future.

In regard to all these income and expenditure streams of the public authorities in the German Federal Republic the present study seeks to give for the last few years a conspectus in terms of figures, using the categories which are usual in the National Accounts. In the course of this process a comparison will also be made, so far as possible, with the period before the war. The public authorities are regarded for the present purpose as comprising all those entities whose receipts are mainly or at least principally derived from imposts fixed by authority, such as taxes and compulsory insurance contributions: that is

to say the territorial authorities in the sense of the Federal Government, the Lands, the local authorities and the Equalisation of Burdens Fund, together with the Social Insurance Institutions and the Unemployment Insurance Fund. Wherever practicable however the figures relating to the territorial authorities and those relating to social and unemployment insurance will be shown not only in one overall total, but also separately, because in many respects the movements in the two groups are from the economic point of view subject to different laws.

The Charge on the National Product in respect of Public Imposts

In 1953 the total public imposts, in the sense of taxes plus social insurance contributions less the subsidies paid out of taxes, amounted to DM 46,000 million. In 1954 they will probably amount to DM 48,000 to 49,000 million. If the

¹⁾ For 1936 in the area of the German Reich, for 1949 and later in that of the German Federal Republic. Differences in the totals are due to rounding off of figures; percentages are calculated from figures with three decimal places. — 2) According to data of the Federal Statistical Office (net national product at market prices plus net factor income payments due to foreigners). — 3) Direct and indirect taxes, including the Coal Levy, less subsidies. — 5) Partly estimated.

total burden of imposts is measured in relation to the net domestic product at market prices¹), one arrives for the year 1953 at a load ratio of not quite 37 per cent, and for 1954 at one which is likely to be 36 per cent. This ratio is higher by about a quarter than in 1936, when it was less than 29 per cent. It is also larger than it was only a few years ago, because up to 1951 the ratio of public imposts to the net domestic product at market prices remained below 33 per cent.

This heavy addition to the impost load has produced highly divergent effects on the various income groups, and accordingly on the entire distribution of the national product. This becomes clear if one adopts the distinction usually made in the National Accounts and regards separately the movement of the indirect and the direct imposts, and if in addition one applies the latter separately to the individual sources of income. For this purpose the indirect taxes are regarded as comprising Customs and Excise duties, the Turnover Tax, the Trade Tax and the Tax on Land and Buildings, that is to say taxes which enterprises show in their accounts as expenses. The direct imposts on the other hand are deemed to consist of all those which are payable out of income, that is to say not only the Social Insurance contributions but also the taxes on income and property, including the Equalisation of Burdens Levies.

From the time of the Currency Reform until the rate of Turnover Tax was raised in the summer of 1951 the charge imposed by indirect taxes on the net domestic product at market prices was not quite 15 per cent. It was thus only slightly greater than in 1936, when it amounted to 14 per cent. After the general rate of Turnover Tax had been put up, the yield of indirect taxes rose to more than 16 per cent of the net domestic product. When certain excise duties were lowered in the autumn of 1953, the ratio representing the burden of indirect taxes slightly declined. In its effect on the distribution of incomes however this tax reduction was partly offset by the fact that there was an end to subsidies — which owing to

their opposite effect on the formation of prices are usually set off against indirect taxes — while at the same time receipts were on balance obtained in connection with the adjustment of prices of imported foodstuffs in the form of the levies imposed for that purpose. The result was that the burden of indirect imposts including the import price adjustment levies tended slightly to rise.

1) For 1936 in the area of the German Reich, as from 1949 in that of the German Federal Republic. Differences in the totals are due to rounding off of figures; percentages are calculated from figures with three decimal places. — 2) National income including net factor income payments due to foreigners. — 3) Including Coal Levy. — 4) Since import price adjustment levies operate like indirect taxes, while subsidies are intended to produce the opposite effect, these amounts are usually added to the indirect taxes or deducted from them. — 5) According to data of the Federal Statistical Office (net national product at market prices plus net factor income payments due to foreigners). — 6) Or plus import price adjustment levies. — 7) Converted to yearly values. — 8) The rate of Turnover Tax was raised in July 1951. — 5) Partly estimated.

During the last few years direct imposts have made much greater demands on domestic income than indirect taxes have. Thus whereas in 1950 21 per cent of the domestic income (that is the net domestic product at market prices, less indirect taxes) was paid to the public authorities in the form of direct imposts, the corresponding proportion in 1953 was 24.3 per cent, and for 1954 it is hardly likely to be much smaller. In

¹⁾ Since the income attributable to foreigners in forms such as wages, salaries and earnings of capital is also subject to tax, it is not possible to take as a basis of comparison the net national product, which does not include the income of foreigners. For the present purpose it is instead necessary to take the net domestic product, which includes the factor income payments due to foreigners, with an offset in respect of corresponding claims on foreign countries.

¹⁾ Differences in the totals are due to rounding off of figures; percentages are calculated from figures with three decimal places. For 1936 in the area of the German Reich, as from 1949 in that of the German Federal Republic. — 2) See Table 2, footnote 2. — 3) Direct taxes and social insurance contributions, including employers' shares. — 4) Gross wages and salaries, including employers' contributions to social insurance, and including pensions of officials. — 5) Deductions from wages and salaries put one month earlier. — 6) Including voluntary contributions. — 7) Income of private and public enterprises including those of farmers and members of liberal professions, and income from capital and the possession of property. — s) Partly estimated.

1936 on the other hand the burden of direct imposts represented only 17 per cent of the national income.

The Social Insurance contributions did not account for any large proportion of this addition to the total load of direct imposts. If taken in relation to the total income of employed wage and salary earners, such contributions amounted in 1949 to less than 15 per cent, so that the load in respect of them did not differ from that in 1936. Owing to the raising of some contribution rates the total contributions increased in 1950 to 16 per cent of the incomes of employed wage and salary earners. Since then the contributions of employed persons have amounted to some 7.7 per cent of the total incomes from that source, while those of the employers have been equal to some 8.3 per cent.

By way of contrast to this the burden of direct taxes shows a very considerable increase. The total yield of such taxes amounted in 1953 to DM 14,500 million, or 14 per cent of the domestic income. In 1950 the total burden of direct taxes was only 11 per cent, and in 1936 it was no more than 7.5 per cent. The individual groups of recipients of income have however been affected by this additional charge in varying degrees. The

incomes of employed wage and salary earners were subject in 1950 to a tax burden of 4 per cent, which had risen by 1952 to 6 ½ per cent. Since that time the load ratio has become somewhat less owing to the Minor Tax Reform, in spite of the fact that one year after the lowering of taxes which then took place the total yield of the Wages Tax was just as high in terms of absolute value as immediately before that reform.

During the same period the direct taxes which are paid out of the income of enterprises increased very much more. In 1953 they produced DM 10,600 million, or 29 per cent of the total income from enterprise, as compared with 23 per cent in 1950 and 19 per cent in 1938. The burden of such taxes in 1936 cannot in this case be taken for the purpose of comparison because in that year the receipts from taxes on enterprises were particularly low, inter alia because they were being paid on the basis of the relatively poor profits which had been obtained in the preceding years of crisis. The reason for the substantial increase which has occurred lies mainly in the great rises that have taken place as compared with the pre-war period in scales of tax, which scales, in so far as they are progressively graded, produce an increasingly burdensome effect as incomes

grow. Besides this there was in 1953 an accumulation of final payments which fell due in addition to the current initial payments of tax. On a comparison with the pre-war period it must further be borne in mind that the Equalisation of Burdens Levies have been added to the taxes previously existing.

Income Transfers

As has been already mentioned, this heavy charge on income in the form of taxes and Social Insurance contributions has not resulted in a fully equivalent contraction of disposable private incomes. The reason is that the income transfers effected by way of the public budgets have represented a much larger proportion of the total national product during the post-war period than they did before the second world war. Whereas in 1936 less than 8 per cent of the net domestic product at market prices was used in the German Reich for public assistance pensions and benefit payments, the ratio of the payments made under this head in 1950 was 11.5 per cent. The growth in the ratio of old people to the total population has by itself considerably increased the number of recipients of old age and disability pensions. Besides this there have been the many victims of the second world war - disabled, widows and orphans, and those who suffered damage from war effects or consequences, and to whom

benefits have also been awarded under the social legislation. The total number of cases of public assistance pensions and benefit being paid in 1950 was something over 11 million, while in 1953 it was about 12.5 million. Although these figures do not show the number of households being so assisted, because it is not known how many persons were at the same time drawing more than one pension or benefit allowance, they do indicate that the people in question constituted a very wide even if not at all homogeneous section of the population. At the same time it can be seen from these figures that the body of recipients of public assistance pensions and benefit payments has continued to grow even during the last few years. The greatest increase has taken place in the number of persons drawing old age and disability pensions, whereas in the case of pensions to war victims for example there has been no further increase since 1952 in the total number of pensions paid. The number of unemployed persons in receipt of benefit has actually declined.

The expenditure in respect of public assistance pensions and benefit payments rose from DM 9,600 million in 1950 to DM 14,500 million in 1953, or by more than a half; and in 1954 it is likely to amount to between DM 15,000 and 16,000 million. This however can be ascribed only in part to the increase in the number of

persons in receipt of such pensions or benefit. A much more important contributing factor was the rise which took place in the individual pension and benefit payments. In 1953 moreover the payments out of the Equalisation of Burdens Fund were expedited, especially those on account of Household Equipment Assistance, so that the total expenditure of the Fund for purposes of consumption amounted in that year to DM 2,100 million. On the whole it can nevertheless be stated that during the last few years the total payments under the head of public assistance pensions and benefit have scarcely risen any more than the domestic product. Thus in 1953 and in the first half of 1954 they accounted for 11.6 per cent and 11.8 per cent respectively of the net domestic product at market prices, as against 11.5 per cent in 1950.

Not only public assistance pension and benefit payments are reckoned as income transfers in the National Accounts, but also the interest on Government debts. Contrary to what was the case before the war, however, the expenditure in respect of such interest has not been of major importance in recent years. This is because the internal indebtedness of the public authorities continues to be small, at least if one disregards the Central Banking System's Equalisation Claims, much of the interest on which comes back to the public authorities.

The Distribution of the National Product after the Shifts in Income caused by the Government

Owing to the fact that since 1950 income transfers have increased in only about the same measure as the domestic product, while public receipts¹) on the other hand have risen a great deal more, the ratio of the disposable income of the public authorities to the total domestic product has become considerably higher. In 1950, with DM 28,000 million of current receipts and DM 10,000 million of income transfers, the disposable income of the public authorities amounted to DM 18,000 million, or not quite 22 per cent of the net domestic product at market prices. By 1953 the total current receipts had risen to nearly DM 48,000 million, but the income

transfers only to some DM 15,000 million, so that after deduction of these latter the public authorities were left in that year with disposable income of DM 32,600 million, or more than 26 per cent of the net domestic product at market prices. In 1954, to judge from the available data, it would seem that the total public receipts have not increased quite so much as the net domestic product, while the income transfers have grown in roughly the same degree, so that the ratio of the Government's disposable income will therefore have slightly declined.

¹) Differences in the totals are due to rounding off of figures; percentages are calculated from figures with three decimal places.

— ¹) Cf. Table 1, Column 4. — ²) Amounts paid over by the public enterprises, receipts from letting for rent, leasing and interest including interest receipts of the E.R.P. Special Fund. Fees, contributions and other forms of reimbursement are not included in the receipts, but are regarded as reimbursement of administrative expenditure and set off against the latter. — ¹) Cf. Table 4, Column 6. — p) Provisional figures.

The way in which as the result of these movements the national income has been distributed during recent years between public authorities and private recipients can be seen from Table 6. Whereas in 1950 as much as 78.2 per cent of the total domestic product still went to enterprises and private persons, their proportion had fallen by 1953 to 73.8 per cent, and for 1954 it will be only slightly higher. Not all categories of private income have however been equally affected by this reduction. It has already been mentioned that during this period the proportion of the domestic product going to public assistance pensions and benefit payments has remained nearly constant, so that only the income arising from wages, salaries and enterprise can have been receiving a lower proportion. In the ultimate

¹⁾ Receipts from imposts of all kinds, including amounts paid over by public enterprises and interest received. Receipts in respect of fees and the like are deducted from the administrative expenditure as representing reimbursement of expenses.

result however the income from wages and salaries has been less affected by these movements, because between 1950 and 1953 the increase in such income as calculated before deduction of taxes was much greater than that in the income of enterprises 1). In this way the increase in the burden of public imposts on the income of wage and salary earners has been largely offset, this being reflected in the fact that the proportion of such persons' disposable incomes to the net domestic product at market prices in 1953 was 42.3 per cent, or not very much lower than its 1950 level of 42.9 per cent. There has on the other hand been a very great decrease in the proportion representing disposable income of enterprises, owing both to the con-

¹⁾ Differences in the totals are due to rounding off of figures; percentages are calculated from figures with three decimal places.

2) Cf. Table 5, Columns 4 and 5. — 3) Income of enterprises (cf. Table 3, column 8) less direct taxes, but plus net interest payments by the Government. — 4) Income of employed wage and salary earners, including officials' pensions (cf. Table 3, column 4) less direct taxes and social insurance contributions. — 5) Cf. Table 4, Columns 4 and 8. — p) Provisional figures.

traction in the profit margin and to the more than proportional growth in direct taxes. Their disposable income in fact amounted in 1953 to only 20 per cent of the net domestic product at market prices, as against 24 per cent in 1950. The shift in disposable incomes in the period from 1950 to 1953 thus took place mainly as between enterprises and the public authorities. It is true that, to judge from the material so far available, this tendency has no longer continued in 1954. In this year on the contrary the available income of enterprises would seem once again to have increased somewhat more than the net domestic product at market prices, while the proportion going to the public authorities would seem to have correspondingly decreased.

The Appropriation of the Public Authorities' Disposable Income

Remarkably enough, the great proportionate increase which has taken place during the last few years in the Government's disposable income has not as its counterpart any similar increase in Government consumption. On the contrary, since 1950 the expenditure of the public authorities for purposes of consumption has risen scarcely any more than the national product. The Government's expenditure on consumption, which is regarded as including all expenditure of the public authorities for administrative requirements of personnel and material, occupation costs, assistance in kind provided by the Social Insurance Institutions and public welfare organisations, together with the current transfers to West Berlin by way of assistance and to foreign countries, in particular to Israel, rose from something over DM 14,000 million in 1950 to not quite DM 23,000 million in 1953, an amount which they are not likely to exceed by very much in 1954.

After having been 17.3 per cent in 1950 the ratio of Government consumption to the total net domestic product at factor costs temporarily rose to 18.7 per cent, but would since seem to have returned again to fully 17 per cent. As regards the years since 1950 it is therefore not possible to say, from the point of view of either Government consumption or income transfers. that there has been any "growing Government demand" in relation to the national product.

¹⁾ As to the reasons for this change in relative positions see the Monthly Report of the Bank deutscher Länder for May 1954, page 32.

1) Differences in the totals are due to rounding off of figures. — 2) Cf. Table 6, Column 2. — 2) Occupation costs: administrative costs for personnel and material: assistance in kind by Social Insurance Institutions and welfare organisations: current transfers by way of assistance to West Berlin. and current transfers to foreign countries (especially to Israel); less fees and contributions. — 1) Including errors of statistical ascertainment. — 5) Including sums set aside as reserve to provide occupation costs not yet called for. Such sums amounted in the financial year 1953/54 to DM 1.800 million.

Even by comparison with the period before the war the Government's consumption during recent years has not been exceptionally high, but is actually somewhat lower than it was calculated to be in 1936. There has been an important change inasmuch as since the war the assistance in kind rendered by Social Insurance Institutions and welfare organisations, including in particular the treatment of the sick and the accommodation of people in hospitals, in homes for the aged and in welfare institutions, has been relatively more important than before the war¹).

If the portion spent on consumption, which has remained almost constant, is set in relation to the growing share taken by the disposable income of the public authorities, then the special feature which has characterised the budgets of these authorities from 1950 to 1954 becomes clear. This is that their disposable income has been exceeding their current consumption expenditure in an increasing degree. Whereas the difference between the disposable income and the expenditure on consumption in 1950 was not quite DM 4,000 million, it had risen by 1953 to DM 10,000 million. In each of these years about onesixth to one-fifth of the difference related to the Social Insurance Institutions including the Unemployment Insurance Fund, and the balance to the remaining public authorities.

Out of this "net saving", as the difference between the disposable income of the public authorities and their expenditure on consumption is called in the National Accounts, the growing expenditure of those authorities in respect of their own capital projects and the granting of loans was financed. In addition the "net saving" includes the payments made to the actuarially required reserve funds of the Social Insurance Institutions, as well as to the reserve funds of the Lands and the local authorities which are required on grounds of budget law. During the last few years "net saving" has been regarded as also comprising the sums set aside to meet demands of the occupying powers which may be expected to arise in the future.

The capital expenditure mentioned, which has risen from something over DM 2,000 million in 1950 to DM 4,000 million in 1953, mainly consists of expenditure serving to finance the extension and new construction of administrative, school and other public buildings, as well as similar work in connection with bridges and roads, that expenditure making it possible to meet the substantial backlog demand in these fields.

The loans and grants accorded by the public authorities have also served to finance capital projects which are in the public interest, and which but for these governmental loans and grants could not have been carried out to the extent which was actually achieved. This applies in particular to the loans at reduced rates of

¹⁾ According to the guiding principles laid down in the O.E.E.C.'s 1952 publication "A Standardised System of National Accounts" the assistance in kind rendered by the various social institutions is included in the Government's expenditure for purposes of consumption. because in this case also the governmental agencies appear directly on the market as buyers. As regards its purpose however the expenditure under this head should be equated rather with income transfers than with the Government's other expenditure on consumption.

interest, and to the grants, for purposes of house construction. A further considerable part of the loans in question was granted under the Equalisation of Burdens scheme, and largely represents lending in anticipation of capital sums which will later be permanently transferred to persons entitled to Equalisation of Burdens benefits. Altogether such public lendings and grants, so far as evidence of them is available in the statistics, rose from a total of something over DM 2,000 million in 1950 to DM 4,500 million in 19531).

In 1950 the total expenditure for capital investment, comprising the Government's own capital expenditure and the loans which it granted, slightly exceeded the so-called net saving. In 1951 such capital expenditure was about equal to, and since 1952 it has been lower than, this net saving. From this it can be concluded that in 1950 the public authorities on balance owed money to the rest of the economy, and in particular to the banks, whereas since 1952 the reverse has been the case. Since that date the public authorities have been able to build up net claims, especially in relation to the banks. On this point the Report of the Bank deutscher Länder for the Year 1953 contained on page 64 some figures,

which however are strictly based on the data as to cash movements, and which therefore differ slightly from the above-mentioned difference between the "net saving" and the capital expenditure, the reason being that the calculations in the present study had to be partly based on the accounting expenditure. According to the Annual Report the formation of net credit balances amounted in 1952 to DM 1,100 million, and to DM 1,400 million in 1953. As already pointed out, this enlargement of the net credit balances represents in the first place planned additions to the covering fund and to reserve funds of various kinds, less the borrowings from banks and private lenders. So far during recent years the post-Currency Reform indebtedness of the public authorities other than the Federal Railways and Federal Postal Administration has not been a factor of very great importance if measured in relation to the actual expenditure for capital purposes. Indeed, owing to the inability of the capital market to function, no more extensive provision of medium or long-term funds for financing purposes would have been possible during that period. Meanwhile no doubt the capital market has become more capable of absorbing Government securities at medium and long term, just as from another point of view the impending large tax reductions are likely to oblige the public authorities to rely more in future on financing their needs by means of borrowed funds. Thus a further return towards normal conditions may be expected in this respect.

¹⁾ Contrary to the figures quoted in the study entitled "The Provision of Medium and Long-Term Funds for Financing Purposes during the First Half of 1954" in the Monthly Report of the Bank deutscher Länder for October 1954, page 40, the figures here given include all the capital expenditures. loans and grants: that is to say not only those which were financed out of regular budget receipts, but also those which various territorial authorities and in particular local authorities financed by means of borrowing.

^{*)} Alterations as compared with previously published figures are due to subsequent corrections. — 1) Excluding Bank deutscher Länder and Land Central buying. In addition almost all of those Agricultural Credit Cooperatives are disregarded which had on 31 March 1948 a balance-sheet total less than head office is located. The branches rendering separate returns have been counted as one institution together with their head office. — Alterations are number of institutions, alterations are explained by separate notes. — 3) Cash, and balances at Land Central Banks. — 4) Balances at less than four years. — are available at the end of each quarter only. — 7) Short and medium-term lendings (up to 4 years). — 8) Including Capital Depreciation Account, unpaid cover according to Art. 11 of the Law concerning Currency Conversion Compensation for expelled Persons, and claims in respect of cover according million of Lands' building loans) into bank lendings. — +) For further breakdown into "Successor Institutions of Former Big Banks", "State, Regional and

German Federal Republic (cont'd)

by Groups of Banks

and the Land Central Banks from the Credit Institutions in the Area of the German Federal Republic

^{*)} Alterations as compared with previously published figures are due to subsequent corrections. — 1) Excluding Bank deutscher Länder and Land Central buying. In addition almost all of those Agricultural Credit Cooperatives are disregarded which had on 31 March 1948 a balance-sheet total less than head office is located. The branches rendering separate returns have been counted as one institution together with their head office. — Alterations are number of institutions, alterations are explained by separate notes. — 3) Cash, and balances at Land Central Banks. — 4) Balances at less than four years. — are available at the end of each quarter only. — 7) Short and medium-term lendings (up to 4 years). — 8) Including Capital Depreciation Account, unpaid cover according to Art. 11 of the Law concerning Currency Conversion Compensation for Expelled Persons, and claims in respect of cover according

^{*)} Alterations as compared with previously published figures are due to subsequent corrections. — 1) Excluding Bank deutscher Länder and Land Central buying. In addition almost all of those Agricultural Credit Cooperatives are disregarded which had on 31 March 1948 a balance-sheet total less than head office is located. The branches rendering separate returns have been counted as one institution together with their head office. — Alterations are number of institutions, alterations are explained by separate notes. — 3) Includes liabilities in foreign currency existing since the RM period. — 4) Only tenbank (Agricultural Mortgage Bank), etc. — 6) Includes "Other Reserves, Amounts placed to Reserve for Specific Liabilities, and Adjustments of Values" for specific purposes, which have not yet been passed on. — 8) Increase in part due to conversion of direct lendings by public authorities (about DM 438 Local Banks", and "Private Bankers", see table overleaf. — °) Breakdown is shown overleaf.

^{*)} Alterations as compared with previously published figures are due to subsequent corrections. — 1) Excluding Bank deutscher Länder and Land Central buying. In addition almost all of those Agricultural Credit Cooperatives are disregarded which had on 31 March 1948 a balance-sheet total less than head office is located. The branches rendering separate returns have been counted as one institution together with their head office. — Alterations are number of institutions, alterations are explained by separate notes. — 3) Includes liabilities in foreign currency existing since the RM period. — 4) Only tenbank (Agricultural Mortgage Bank), etc. — 6) Includes "Other Reserves, Amounts placed to Reserve for Specific Liabilities, and Adjustment of Values" for specific purposes, which have not yet been passed on. — 8) Figures for all Agricultural Credit Cooperatives are shown in Table V, 2.

^{*)} Alterations as compared with previously published figures are due to subsequent corrections. — 1) Excluding Bank deutscher Länder and Land Central Banks, excluding Postal Savings Bank Offices and Postal Cheque Offices, Reconstruction Loan Corporation, Finag, and institutions financing instalment buying. Also excluding almost all of those Agricultural Credit Cooperatives which had on 31 March 1948 a balance-sheet total less than RM 2 million. The proportion of the institutions thus disregarded to the balance-sheet total shown in the tables is very small. — *) Excluding deposits of Agricultural Credit Cooperatives, contained in columns 1 and 6, for which no breakdown according to columns 9 to 16 is available at quarterly intervals only. — 4) Sight deposits are considered to be monies payable on demand and deposits for which a period of notice of less than 1 month, or a fixed period of less than 30 days, has been agreed. — *) The Investment Accounts have been transferred to Sight or Savings Deposits as from January 1954. — p) Provisional figures.

c) Deposits classified by Lands 1) 2)

of Source: Deutscher Raiffeisenverband e.V. (German Association of Farmers Credit Cooperatives), Bonn. The figures in this Table cover the transactions of all savings and loan cooperatives, whereas the monthly statistics collected by the Central Banking System only cover some 1,600 institutions; cf. Tables V. 1 (a) and VII, 3 (d). While the June and December figures are based on data collected from all agricultural credit cooperatives, the results for March and September have been estimated on the basis of sample statistics of the Deutscher Raiffeisenverband. — ³) Excluding the three commercial banks affeliated with the Deutscher Raiffeisenverband, namely Hannoversche Landwirtschaftsbank AG, Hannover, Landkreditbank Schleswig-Holstein AG, Kiel, Württembergische Landwirtschaftsbank GmbH, Stuttgart, which in the monthly statistics of the Central Banking System are included in the group "State, Regional and Local Banks". — ³) Claims on current account, including trade claims.

^{*)} Alterations as compared with previously published figures are due to subsequent corrections. — 1) Including foreign bills and export drafts purchased and, as from September 1952, also including the bills of the Import and Storage Agency held by the BdL. — 2) The lendings to the Berlin Central Bank comprise inland and foreign bills purchased, export drafts purchased, and Equalisation Claims accepted as security for advances. — 3) As from December 1952, partly converted into $5^{1/2}$ % Reconstruction Loan Corporation bonds, resulting in a corresponding increase in the securities held by the Bank deutscher Länder.

3. Short, Medium and Long-Term Lendings by Credit Institutions a) Area of the German Federal Republic

Monthly Banking Statistics*)1); Collected jointly by the Bank deutscher Länder and the Land Centra! Banks from the Credit Institutions in the Area of the German Federal Republic (In millions of DM)

^{*)} Alterations as compared with previously published figures are due to subsequent corrections. — 1) Excluding Bank deutscher Länder and Land Central Banks, excluding Postal Savings Bank Offices and Postal Cheque Offices, Reconstruction Loan Corporation, Finag, and institutions financing instalment buying. Also excluding almost all of those Agricultural Credit Cooperatives which had on 31 March 1948 a balance-sheet total less than RM 2 million. The proportion of the institutions thus disregarded to the balance-sheet total shown in the tables is very small. — 2) Includes medium-term transitory credits. — 3) Mortgages, loans based on communal security, other long-term lendings, and long-term transitory credits. — 4) Increase in part due to conversion of direct lendings by public authorities (about DM 438 million of Lands' building loans) into bank lendings. — P) Provisional figures.

b) By

^{*)} Alterations as compared with previously published figures are due to subsequent corrections. — 1) Excluding Bank deutscher Länder and Land Central buying. In addition almost all of those Agricultural Credit Cooperatives are disregarded which had on 31 March 1948 a balance-sheet total less than term transitory credits. — 4) Increase in part due to conversion of direct lendings by public authorities (about DM 438 million of Lands' building loans)

^{*)} Alterations as compared with previously published figures are due to subsequent corrections. — 1) Excluding Bank deutscher Länder and Land Central buying. In addition almost all of those Agricultural Credit Cooperatives are disregarded which had on 31 March 1948 a balance-sheet total less than term transitory credits.

^{*)} Alterations as compared with previously published figures are due to subsequent corrections. — 1) Excluding Bank deutscher Länder and Land Central buying. In addition almost all of those Agricultural Credit Cooperatives are disregarded which had on 31 March 1948 a balance-sheet total less than term transitory credits. — 4) Increase in part due to conversion of direct lendings by public authorities (about DM 438 million of Lands' building loans) Bankers", see table overleaf. — 0) Breakdown is shown overleaf.

Lendings by Credit Institutions (cont'd)

^{*)} Alterations as compared with previously published figures are due to subsequent corrections. — 1) Excluding Bank deutscher Länder and Land Central buying. In addition almost all of those Agricultural Credit Cooperatives are disregarded which had on 31 March 1948 a balance-sheet total less than term transitory credits. — 4) Figures for all Agricultural Credit Cooperatives are shown in Table V, 2.

¹⁾ Credits granted by all credit institutions rendering returns for purposes of the banking statistics kept by the Bank deutscher Länder and the Land Central Banks, institutions financing instalment buying, Reconstruction Loan Corporation, Finag, Postal Cheque Offices and Postal Savings Bank Offices. The figures do not include some 9.500 small agricultural credit cooperatives, which at the end of September 1954 had a volume of credit amounting to about DM 660 million. The data on short-term lendings (other than the figures supplied by the institutions financing instalment buying) have been estimated on the basis of partial statistics collected from some 760 institutions. —

2) Stones and earths, flat glassware, sawmills and woodworking, building and allied trades. —

3) The credits granted by the agricultural credit cooperatives not included in the figures (see note 1)) probably represent, to a relatively large extent, credits to agriculture. —

4) This includes all credits granted to public authorities, in so far as these are not shown among the individual branches of conomic activity or industries, as well as those credits, some of which are shown separately in the statistics relating to borrowers, which are granted for the building and maintenance of roads, road bridges, harbours and waterways. —

5) Credits granted for use in connection with transport and communications, the hotel and tourist industry, as well as those for "other private borrowers" and those designed to afford extra time for payment of freight charges. —

5) Short-term credits: unclassifiable credits granted by mortgage banks, other institutions and supra-regional institutions; and also, at the end of 1949, DM 126 million of unclassified converted RM credits. Medium- and long-term credits: lendings made by banks outside the Central Banking System before the Currency Reform.

¹⁾ Differences from information published earlier are due to correction. The table does not include the DM 360 million which the Federal Railways received out of GARIOA monies to pay for imported waggons, nor does it contain the DM 100 million of GARIOA monies which Berlin received, in May 1951, for financing investment credit. — 2) As from August 1951, included in the amounts passed on through Reconstruction Loan Corporation. — 3) As from March 1953, including M.S.A. monies. — 4) The decline in August 1954 is due to a temporary cut in the Programme which was undergoing certain changes.

[&]quot;) Deposits of non-bank customers only. — 1) Excluding Notes of Category "B"; cf. footnote 19. — 2) The figures include the deposits at all credit institutions with the exception of those credit institutions (as from October 1951, with the exception of those Agricultural Credit Cooperatives only) which had on 31 March 1948 a balance sheet total less than RM 2 million. The proportion of the credit institutions thus disregarded to the total volume of deposits is very small. — 3) Including a statistical increase of DM 689 million. — 5) The credit balances of the STEG Administration, at DM 133 million, hitherto included in column 10, were transferred to column 14. — 5) After inclusion of a number of institutions not previously covered by the monthly banking statistics (cf. also footnote 2). — 8) As from December only the special account of the Berliner Industriebank. The special accounts of the Reconstruction Loan Corporation were transferred to "Counterpart Accounts of the Federal Government" (column 14). — 9) Partly invested in other securities. — 19) As from December 1953, including the notes issued in West Berlin (formerly notes of category "B"); circulation on 30 November 1953: DM 657 million. — 11) Decline due to transfer to "Other Accounts" of the Federal Government (columns 8 and 9) of some accounts (DM 107 million) previously shown under "Counterpart Funds". — 12) Possible changes in the cash holdings of credit institutions have not been taken into account. — p) Provisional figures.

1) The figures of the Equalisation Claims under Conversion Legislation have been compiled on the basis of the confirmed provisional Conversion Accounts, or, where these have not yet been confirmed, on that of the surveys which the institutions had to submit for the purpose of calculating the interest as at 30 April 1953. — 20 March 1949]. — 3) Normal type for credit institutions (Area of the German Federal Republic: Art. 11, Conversion Law; West Berlin: Supplementary Conversion Regulation of 20 March 1949]. — 3) Normal type for insurance companies and building and loan associations (Area of the German Federal Republic: Art. 11 of Implementing Regulation 3 under Supplementary Conversion Regulation of 20 March 1949). — 4) For the purpose of covering bonds and similar securities issued by the appropriate institutions (Art. 2 of Reg. 27/Conv. Law). — 5) For conversion costs (Area of the German Federal Republic: Art. 2, Reg. 45/Conv. Law) and for certain reserves of insurance companies (Art. 15, Reg. 20 March 1949). DM 114 million redeemed in the meantime; hence remaining balance for Federal Area DM 95 million. — 7) On account of money supply to the Supplementary Pension Payments dated 11 June 1951 (amount according to figures of the Federal Deta Administration as at 31 Dec. 1953). — 8) In accordance with Art. 5 of the Law on interest for the time being. — 19) In the absence of relative reports the Equalisation Claims of a large number of small insurance companies (hardly exceeding Claims of all categories of creditors (DM 19.707 million) and the total of Equalisation charges of the Federal Government and Lands according to Table b) (DM 19.825 million) is due to the fact that the Annuity Equalisation Claims of the West Berlin insurance companies (DM 118 million on 31 Dec. 1953) are included in the obligations of the Federal Government. — 12) See footnote 11).

¹⁾ The Equalisation Claims have as a rule been allocated to that Land in which the institution in question has its seat. Thus the survey largely disregards the allocation of the Equalisation charge to several Lands in accordance with a) Art. 10. paragraph 5 of Regulation 2 under the Conversion Law (in respect of credit institutions with branches in several Lands), b) Art. 8 of Regulation 35 under the Conversion Law (in respect of banks and similar institutions).
c) Art. 6, paragraph 2 of Regulation 46 under the Conversion Law (in respect of Postal Cheque Offices), furthermore the internal allocation of the Equalisation charge in respect of insurance companies and building and Ioan associations in accordance with Art. 10 of Regulation 23 and Art. 3 of Regulation 33 under the Conversion Law. — 2) See footnote¹) to table a) above. — 3) See footnote² of the territorial authority of Greater Berlin for the same amount. — 4) See footnote s) to table a) above. — 5) See footnote in to table a) above. — 5) See footnote and building and Ioan associations in accordance with Art. 4 of Military Government Law No. 67 the Federal Government receives a debt certificate of the territorial authority of Greater Berlin for the same amount. — 4) See footnote s) to table a) above. — 5) See footnote in the same amount. — 5) See footnote in favour of the Federal Government as mentioned in footnote s). — 7) See footnote in to table a) above.

^{*)} Differences from the figures shown in Table X, 1, "Offerings and Placings of Fixed-Interest-Bearing Bonds and Shares" are due in the first place to the fact that that table represents sales statistics which do not take account of amortisations (totalling DM 84.6 million up to the end of October 1954). In addition, in that tabulation the Federal Railways 1949 Loan is shown at the full amount issued, namely DM 500.4 million, while in the above table the loan has been entered after deduction of the amounts temporarily converted into Special Treasury Bonds, which latter are shown in the following Table XI, 5. — 1) Cf. footnote. ") — 2) The loan is included in Table X, 1, under "Bonds of Special Credit Institutions". — 5) Estimated.

¹⁾ Position at end of each month indicated. The zero positions result from the fact that the balances of the countries concerned were set off, at first by "Initial Credit Balances" and later by "Special Resources". = The quota shown is that applying at the last date indicated; previous changes have been taken into account. The quota of Greece as debtor is frozen; the creditor quota of the B.L.E.U. is 402.6 million units of account. — 3) Clearing facilities in excess of quotas of creditors (C) or of debtors (D). — 4) Including - 20.5 million units of account representing a "Sandwich Tranche" which is fully to be settled in gold. — 5) Including + 22.9 million units of account representing a "Sandwich Tranche" which is fully to be settled in gold. — 6) After the adjustments resulting from the reorganisation of E.P.U. (cf. Monthly Report of the Bank deutscher Länder for July 1954, p. 26 et seq.) have been made. — 7) Taking into account the payments under the bilateral consolidation agreements.

4. Position on the Bank deutscher Länder's Accounts in Relation to "Other Offset Account Countries"+)
