## **| The current economic situation in Germany**

## Overview

### German economy back to stronger growth in the second quarter

*Global activity regains momentum in second quarter*

Following a slight slowdown in growth over the past few quarters, global economic activity rebounded in the second quarter of 2018. The upswing stabilised in the advanced economies, in particular. The United States recorded its strongest growth in real gross domestic product (GDP) in nearly four years. After a setback in the first quarter, the Japanese economy returned to its path of growth, while in the United Kingdom the pace of expansion picked up distinctly. Euro area economic output, meanwhile, continued to increase at an unchanged moderate rate. The high level of growth in China also remained largely stable compared to its international peers.

*As yet no major impact of further escalation of trade policy conflicts*

Despite ongoing efforts to reach negotiated solutions, several trade policy conflicts escalated. However, this was probably not the main reason why sentiment in the manufacturing sector, while still fundamentally positive, has clouded over since the beginning of the year. Recent survey results have been less favourable, particularly among those economies which had benefited from particularly buoyant industrial activity in 2017. In those countries affected the most by trade-restrictive measures, the relevant purchasing managers' indices barely budged. Nonetheless, an escalation of these disputes could weigh considerably on global economic growth.

*Differences in business cycle position and monetary policy stance impacting on financial markets*

In the second quarter and the early part of the third quarter, international financial markets reflected the, on the whole, robust economic growth, the intensity of which varied from one currency area to the next, however. Monetary policy decisions, along with expectations of the future economic policy stance, also showed evidence of these differences. The Federal Reserve continued to gradually hike its policy rate.

Whereas at the end of March only one interest rate move had been expected for the second half of 2018, the sound outlook for the economy meant that the most likely scenario at the end of the reporting period was two interest rate moves over the rest of the year. By contrast, at last report the euro area was not expected to see an initial interest rate increase until the second half of 2019. This was due in large measure to the ECB Governing Council's communication of mid-June, which was perceived as being accommodative. Concern about how the trade conflicts between the major economic areas would progress, uncertainty about the thrust of the new Italian government's policy, and the sharp depreciation of the Turkish lira led at times to safe haven flows. The (implied) volatility in the financial markets, however, rose only in isolated cases and remained, on the whole, near its long-run average. On balance, the yields on ten-year Bunds dropped, whereas those on matched-maturity US Treasuries rose. At times, the yield spread was at its highest level since the late 1980s. The GDP-weighted yield for the euro area excluding Germany picked up as well, particularly owing to the increase in the interest rate on Italian sovereign debt. The yields on euro area corporate bonds likewise inched up slightly. Equity markets largely tracked the positive cyclical movement, yet in the euro area the aforementioned political uncertainty dampened the dynamics of equity prices. On a weighted average against the currencies of 19 major trading partners, the euro slipped slightly, on balance. Significant losses against the US dollar were made up for in part by gains against other currencies.

Given the considerable progress made in sustainably adjusting the path of inflation to its medium-term target, at its meeting in June the ECB Governing Council announced the time horizon for exiting its net purchases, which had begun in March 2015 as part of its extended

*Monetary policy: ECB Governing Council announces decision on asset purchases ...*

asset purchase programme (EAPP). Subject to confirmation of its current assessment of the medium-term outlook by newly available data, the ECB Governing Council anticipates that it will reduce its current volume of monthly asset purchases from €30 billion to €15 billion after the end of September 2018 and discontinue purchases entirely after the end of December 2018. The principal payments from maturing securities are to be reinvested for an extended period of time after the end of the net asset purchases, and in any case for as long as necessary, in order to maintain favourable liquidity conditions and an ample degree of monetary accommodation.

*... and strengthens its forward guidance*

While leaving policy rates themselves unchanged, the ECB Governing Council, at its June meeting, strengthened its forward guidance. It expects policy rates to remain at their present levels at least through the summer of 2019, and in any case for as long as necessary to ensure the continued sustained convergence of inflation to levels that are below, but close to, 2% over the medium term.

*Monetary dynamics in the euro area increasingly driven by loan growth*

Following two significantly weaker quarters, in the spring months the broad monetary aggregate M3 in the euro area returned closer to the robust growth from the previous year. This was mainly because lending to the private sector rebounded at an accelerated pace. With economic growth continuing to be sound, loans to non-financial corporations and to households again climbed considerably. The growing demand for credit was sustained by the low-interest-rate setting and a further easing of commercial banks' credit supply conditions. By contrast, the reduction in monthly net asset purchases by the Eurosystem effective as of January has had a dampening yet, to date, limited overall impact on monetary growth.

*German economy back to stronger growth in the second quarter*

After a moderate start to the year, aggregate economic activity rebounded quite strongly in spring 2018. According to the flash estimate by the Federal Statistical Office, the growth rate of real GDP, after adjustment for seasonal and cal-

endar effects, rose marginally from the first quarter of 2018 to 0.5%. Diminishing one-off effects such as the extremely virulent wave of influenza, which had dampened economic activity in the winter months, are likely to have had merely a limited impact. This meant that the economic boom in Germany was still ongoing. However, the pace of growth in the first half of 2018 failed to match the high rates of the previous year, and the current underlying cyclical trend is probably only marginally above the potential rate. The already high degree of aggregate capacity utilisation is therefore only edging up. Private consumption – currently the linchpin of economic expansion – continued its ascent in the spring. Government consumption probably likewise rose significantly following a distinct decline in the previous quarter, the first in many years. Moreover, following a drop at the beginning of the year, exports grew moderately. The same is probably the case for commercial investment in machinery and equipment.

In the second quarter of 2018, industrial activity remained largely listless. Although the manufacturing industry may well have contributed slightly to aggregate growth, it was unable to re-assume its previous year's role as the key driver of economic activity. The upturn continued for business-related services. In spite of existing capacity constraints, construction output increased once again.

*Industry weak; services and construction, by contrast, dynamic*

In Germany, too, the domestic private sector's demand for loans accelerated. This was consistent with the German economy's sound growth, the low level of interest rates and the continued easing of banks' credit supply conditions. For the first time since 2012, the non-financial corporations sector recorded the largest net inflows of loans in the reporting quarter; the annual rate of growth of these loans rose to 5.9% at end-June, its highest mark since 2008. Loans to households in Germany picked up significantly as well, particularly owing to brisk demand for housing loans.

*Accelerated, broadly based expansion of lending to the domestic private sector*

Given the stable consumer climate, consumer loan growth likewise strengthened.

*Labour market situation and outlook very favourable*

In the second quarter, the labour market in Germany was still in a very good state of health, characterised by high employment and low unemployment. However, the situation did not improve as much as in previous quarters: although employment rose markedly, this growth was no longer as buoyant. Employment growth continued to be driven by jobs subject to social security contributions. Exclusively low-paid part-time employment, as before, fell slightly, while self-employment dropped more significantly. In the quarter under review, unemployment likewise did not fall as sharply as in the winter, yet given the low level achieved, this fall was still quite considerable. Over the same period, the number of job vacancies went up only a little from the exceptionally high level previously achieved. Other, survey-based leading indicators of labour market developments either fell slightly or remained virtually unchanged in the last few months. On the whole, the outlook for the labour market remains good.

*Negotiated wages up more strongly in spring*

Negotiated wages rose sharply in the spring quarter, reflecting recent wage settlements which, given a healthy economy and a tight labour market, were higher than in the last pay round. The rise in negotiated rates of pay including all additional benefits in spring 2018, at 3.2% on the year, was significantly higher than just three months before. Already in the first quarter of 2018, actual earnings had picked up somewhat more strongly than in earlier periods. This trend could well have continued in the second quarter. Following a unanimous decision, at the end of June the independent Minimum Wage Commission submitted a recommendation to the Federal Government to raise the general minimum wage from €8.84 per hour to €9.19 per hour. In a second stage as of January 2020, it should then go up to €9.35 per hour. The Federal Government announced that it would implement this proposal.

Consumer prices (measured by the Harmonised Index of Consumer Prices, or HICP) continued to rise sharply in the second quarter. Roughly half of the seasonally adjusted 0.6% quarter-on-quarter increase was attributable to energy prices, reflecting the distinct rise in crude oil prices denominated in US dollars, the effect of which was amplified by the depreciation of the euro. Food products likewise became markedly more expensive. This was due also to hikes in the price of tobacco products, which the HICP counts under food. Excluding energy and food, prices rose similarly moderately to the previous quarter. Prices in several sub-sectors of the services sector went up, including rents. The prices of industrial goods excluding energy barely inched upwards on the quarter, but began to accelerate over the course of the second quarter. One reason for this may be that import prices for the relevant goods rose markedly owing to the euro's depreciation against the US dollar. At the commercial producer level, too, prices continued their gradual climb. The headline annual HICP inflation rate rose clearly from 1.3% to 1.9%. It even passed the 2% mark in May and June owing to the sharp rise in energy prices. Excluding energy and food, annual inflation in the spring was more or less constant at 1.2% and, consistent with aggregate overutilisation, remained above its longer-term average.

*Sharp rise in consumer prices in spring*

The German economy will probably remain on a sound growth path in the third quarter as well. The rate of growth could end up being somewhat slower than the average for the first half of the year, however. Thus, industry is not expected to make any meaningful contribution to aggregate growth. Although the stock of orders still being processed remains exceptionally high and short-term output expectations in the manufacturing sector have stabilised at an elevated level, new orders received by industry were also down in the quarter under review. To exacerbate matters, problems encountered during the transition to a new emission test cycle are likely to have markedly constrained motor vehicle production in the summer

*German economy set to stay on expansionary course*

months. Private consumption, on the other hand, is likely to benefit from the excellent labour market situation and the current strong wage hikes, thus maintaining its role as a key driver of German economic growth.

be initially funded from contributions. Only as from 2025 would this impose a relatively heavy burden on the Federal budget. A more appropriate idea would be to use Federal grants, ie via general tax revenue, to fund the new non-insurance-related payments. This would, moreover, largely obviate the need for the planned limits to the long-term contribution rate and pension level up until 2025. According to the calculations presented, excluding the additional burdens, only for the pension level would these limits have become binding in 2025.

*Favourable development of public finances in current year*

German public finances are continuing to develop favourably. The general government surplus is likely to keep rising in the current year. The debt ratio has remained on its downward trend and is expected to come close to the 60% limit by the end of the year. Public finances are benefiting from the favourable economy. In addition, temporary burdens have declined because the effect of the nuclear fuel tax repayment in 2017 has expired. Revenue has been on the rise as well, even independent of the cyclical upswing. This is being supported by the structurally positive labour market development, which has also been dampening expenditure growth. While interest expenditure has been decreasing, expenditure in other areas has gone up significantly.

The outlook for pension insurance post-2025 is currently uncertain. Demographic trends will exert an increasing burden from then on, and fundamental pension reform has been announced. Reaching a quick agreement would give all parties involved considerably more planning certainty. In the process, long-term projections should be conducted in order to make transparent the expected trends and burden-sharing. The currently sound economic and financial situation should not entice decision-makers to shift the adjustment pressure unilaterally to the central government budget. Given the tax burden going forward, domestic tax conditions should not be disregarded, either. Raising the statutory retirement age beyond 67 years could also contribute towards stabilising pension finances. As this would also dampen the decline in headcount employment, potential growth and the tax base could be supported in this manner as well. In other countries, the statutory pension age is pegged, for instance, to life expectancy.

*... improve planning certainty*

*Fiscal loosening will cause surplus to decline in coming years*

As things stand, the framework conditions for public finances also look set to remain positive in the medium term. However, the surplus could well decline since a significant fiscal loosening is in the offing. Measures to that effect are enshrined in the Federal Government coalition agreement and are currently being gradually fleshed out. State and local governments will likewise probably make greater use of their fiscal leeway.

*Put pension finances on sound footing and ...*

The current situation, which is good now and will probably remain so in the years to come, should not detract from the long-term challenges, which include demographic trends. To that extent, the rapid reduction in the debt ratio, making public finances better prepared for these challenges, is a welcome development. This will also render budgets less vulnerable to rising interest rates. However, the current pension policy plans will increase the pressure already resulting from demographic trends. The vast majority of the additionally envisaged burdens on pension insurance are to

In early July, the fiscal planning for the central government budget as from 2019 was adopted. The Federal Government is sticking to its target of a balanced budget, which means it will continue its policy of no new net borrowing. It is making plans for considerable structural deficits, however. The only way it will be able to comply with the debt brake is by tapping reserves. Although the plans for this year and the next appear, on the whole, to be prudent, the room for manoeuvre is likely to be increas-

*Central government increasingly utilising its fiscal leeway*

ingly exhausted by 2022. The solidarity surcharge is set to be maintained in some places, which is legally contentious. Amongst other things, convergence towards international agreements regarding defence expenditure or development aid could entail an additional fiscal need.

*Planning is not transparent*

The Federal Government's plans are difficult to analyse. Copious use of reserves and off-budget entities is making them ever more complex. Relevant information on the debt brake, which should be one of the centrepieces of budget planning, is lacking as well. Thus, struc-

tural net borrowing as from 2020 cannot be gauged because there are no budget estimates for off-budget entities. In addition, risks cannot be readily assessed because the high global provisions for as yet unspecified additional or reduced revenues or expenditures, as a potential buffer, have not been explained in detail. The reserve withdrawals – which are probably only planned as an initial measure – mask the underlying structural fiscal position. It would be desirable to heighten the transparency of planning by providing timely, comprehensive information.

## Global and European setting

### Global economic developments

*Global economy more buoyant again in second quarter*

Following a slight slowdown in growth over the past few quarters, global economic activity rebounded in the second quarter of 2018. The upswing stabilised in the advanced economies in particular. The United States recorded its strongest growth in real gross domestic product (GDP) in nearly four years. After a setback in the first quarter, the Japanese economy returned to its path of growth, while in the United Kingdom the pace of expansion picked up distinctly. In the euro area, the aggregate economic upturn carried on unchanged at a moderate pace. The high level of growth in China compared to its international peers also remained largely stable. At the same time, the gradual overall economic recovery in Russia continued, while a temporary downturn in Brazil is on the horizon, partially due to one-off effects.

*Trade conflicts pose significant downside risk for global growth outlook ...*

In line with the most recent – and overall favourable – economic data, the staff of the International Monetary Fund (IMF) confirmed its projections for the global economy from the April edition of the World Economic Outlook in July. Despite relatively small downward revisions in the projections for some European economies and Japan, as well as a distinct downward revision for Latin America, buoyant growth in global GDP is to be expected this and next year. However, not least due to a further intensification of trade disputes, the downside risks have increased considerably.

Due to infringement of intellectual property rights, the United States imposed tariffs on certain goods imports from China at the beginning of July. These measures could be expanded in the coming months to cover additional categories of goods. Ongoing studies by the US government into whether imports of motor vehicles and associated parts affect national

security could – as has already been the case with aluminium and steel – lead to additional trade-restricting measures. Major trading partners of the United States, including the EU and China, were indeed receptive to finding solutions through negotiation, but responded to these protectionist steps taken by the United States with targeted countermeasures of their own. An escalation of these disputes could weigh considerably on global economic growth.<sup>1</sup>

Such a risk scenario, along with the measures already taken, raises the question as to whether protectionist efforts are already having an impact on global economic activity. The deterioration of sentiment – which nevertheless remains positive – amongst enterprises in the manufacturing sector since the start of the year has occasionally been interpreted as an indication of negative confidence effects.<sup>2</sup> However, the suggestion that this is the main reason is contradicted by the fact that purchasing managers' indices in the countries that were likely to have been most severely affected by trade-restrictive measures saw only little change.<sup>3</sup> In the United States, Mexico, and Canada, this index was even higher in July than it had been in December of the previous year; in China, it was somewhat lower. A normalisation of sentiment amongst industry in some European countries, which had previously been exceptionally buoyant, was the key reason for the

*... but not quite enough to dampen sentiment amongst industry*

<sup>1</sup> See Deutsche Bundesbank, The danger posed to the global economy by protectionist tendencies, Monthly Report, July 2017, pp 77-91.

<sup>2</sup> A similar argument was most recently presented by the staff of the IMF, amongst others, which highlighted the fact that more negative survey results had been observed particularly in countries with high degrees of openness. See International Monetary Fund (2018), G-20 Surveillance Note prepared by the staff of the International Monetary Fund for the G-20 finance ministers and central bank governors meetings from 21 to 22 July 2018.

<sup>3</sup> Alongside the United States, these are Mexico, Canada, and China. The order reflects their ratios of export value, which could be affected by newly introduced or threatened tariffs, to GDP.

### Purchasing managers' indices for manufacturing in the G20\*

Seasonally adjusted, monthly data

Deutsche Bundesbank

*Upward movement of crude oil prices stopped for now*

downward movement in the global indicator. Industrial production also rose in the first half of 2018, especially in the advanced economies – though it was off from the high rate of the previous year – and global trade lost some of its momentum.

Against this backdrop, prices of industrial commodities have fallen markedly across the board since June. Crude oil prices recently saw another slight decline, too. According to figures from Bloomberg, a barrel of Brent crude oil cost, on average, just over US\$74 on the spot market in July 2018, after having traded for just under US\$77 as late as May. The decision by OPEC and other major oil-producing countries to increase production is likely to have contributed to the slight fall in prices. Furthermore, US production hit record highs, highlighting the vital role that this comparatively price-elastic supply has on developments on the oil market. By contrast, US sanctions on Iran and the continuing decline in production in Venezuela, in

particular, are likely to have propped up prices. There were also temporary production stoppages in Libya and Canada. The production stoppage in Canada reduced the supply of North American oil and thereby helped to narrow the price spread between Brent and WTI crude oil, which had been very wide at times. As this report went to press, the spot price for a barrel of Brent crude oil was US\$70, representing a year-on-year increase of around 40%. Price reductions, in particular for longer-term delivery dates, and declining base effects point to annual growth rates falling again.

As a consequence of higher crude oil prices, consumer prices for energy in industrial countries rose considerably over the course of the second quarter. At nearly 10%, the year-on-year increase in June was double what it had been in March. Accordingly, headline consumer price inflation grew from 2.0% to 2.3%, the highest rate since March 2012. However, if energy and food are excluded, inflationary pressures remained moderate. As had been the case three months earlier, the core rate stood at 1.6% in June.

*Sharper consumer price inflation in industrial countries*

### Selected emerging market economies

With a year-on-year GDP increase of 6.7%, the rate of growth in China in the second quarter of 2018 was only negligibly lower than at the beginning of the year. Contrary to some fears, there was no significant slowdown. The steep rise in goods imports in the first half of the year as well as purchasing managers' continually favourable assessment of the current situation are consistent with largely stable economic developments. In the second quarter, private consumption emerged as the main driving force of economic growth on the demand side. According to surveys, sentiment among households was very positive throughout the reporting period. The excellent labour market situation and only muted consumer price inflation, amongst other factors, are likely to have con-

*China's rate of growth virtually unchanged*

tributed to this. The rate of consumer price inflation even fell slightly in the second quarter to 1.8% on the year.

*Faster GDP growth in India*

In India, year-on-year economic growth increased to 7.7% at the beginning of the year. It seems that this pace could not quite be sustained in the second quarter, which, in any case, is suggested by the indicators currently available. Industrial production lacked momentum in recent months and, according to surveys, consumer confidence remained low. Although food price inflation declined, headline inflation rose. On average for the months from April to June, the consumer price index (CPI) exceeded the previous year's value by 4.8%. In light of these developments, the Reserve Bank of India raised its policy rate in June to 6.25%. This was the first time that it had tightened its monetary policy stance in more than four years.

*Probable setback to recovery in Brazil*

The overall economic recovery in Brazil made only limited progress in the first quarter of 2018. Compared with the previous year, real GDP grew by 1.2%. Official data for the second quarter are not yet available. However, after an eleven-day lorry drivers' strike crippled major parts of the transport infrastructure in May, a temporary setback may be expected. For that month, the Central Bank of Brazil's activity indicator recorded a slide of 3.3% compared with April, the largest one-month loss since its inception in 2003. Although the situation normalised again in June, a considerable decline was recorded for the quarter as a whole. Especially strong consumer price inflation was recorded in June due to strike-related supply bottlenecks and higher food prices. In the second quarter, consumer prices were up by an average of 3.3% on the year.

*Persistently moderate growth in Russia*

According to a provisional estimate, year-on-year economic growth in Russia accelerated to 1.8% in the second quarter, representing persistently moderate growth. Private consumption – which was boosted not least by considerable growth in wages, falling unemployment,

**World market prices for crude oil, industrial commodities and food and beverages**

 Deutsche Bundesbank

and increased lending to households – probably continued to be an essential pillar of growth in the second quarter. The FIFA World Cup perhaps also provided a degree of positive growth stimulus in June and July.<sup>4</sup> At the same time, consumer price inflation remained subdued. Annual CPI inflation averaged 2.4% over the April to June period.

<sup>4</sup> The Central Bank of Russia estimates that, for 2018 as a whole, the FIFA World Cup resulted in growth stimulus of 0.1 to 0.2 percentage point. The majority of this is likely to be recorded in the second quarter.

*Strong economic growth in second quarter*

## United States

In the United States, the economic upswing gained momentum in the second quarter. In seasonally adjusted terms, overall real economic output rose by 1.0% compared with the first quarter, in which it had grown by 0.6%. As was the case in the preceding quarters, commercial and industrial investment was expanded significantly, though this must also be viewed in the context of the tax reform that came into effect at the beginning of the year.<sup>5</sup> Extraordinarily brisk foreign business also contributed to the acceleration. In price-adjusted terms, exports recorded their strongest growth in four and a half years. However, this was partially due to a sharp, and likely unsustainable, increase in exports of foodstuffs, feedstuffs and beverages.<sup>6</sup> The strong underlying dynamic is likely to turn out to be more persistent in the case of private consumption expenditure, which saw substantial expansion following a dip in growth at the start of the year. In any case, the underlying framework conditions for private consumption remain favourable: according to current data, households' rate of saving is – at just under 7% – far above the record lows seen from 2005 to 2007.<sup>7</sup> Employment also continued to rise in July, and the rate of unemployment again dropped below 4%. Against the background of high aggregate capacity utilisation, the annual CPI excluding energy and food reached 2.4% in the same month. At 2.9%, the headline rate was higher still. In light of the overall economic developments and price trends, the US Federal Reserve maintained its stance of gradually normalising monetary policy and raised its policy rate by 25 basis points in June.

## Japan

The Japanese economy returned to a path of growth in the second quarter. A provisional estimate shows that real GDP grew noticeably by a seasonally adjusted 0.5% from the preceding quarter, in which economic output had

declined. This countermovement was triggered by a substantial increase in domestic demand; private consumption in particular picked up considerably, while business investment also grew more strongly than before. Expenditure in private residential investment was reduced once again, however. Imports increased in line with the buoyant domestic economy. By contrast, exports continued to increase only moderately, meaning foreign trade slightly dampened aggregate growth in arithmetical terms. Unemployment reached a new cyclical low at 2.4% in the second quarter. Aggregate wage growth accelerated somewhat given the favourable labour market situation, and the results of the spring wage round also suggest that momentum has picked up slightly. Inflation, however, has remained extremely muted so far. The CPI excluding energy and food in June did not exceed the previous year's level. Against this backdrop, the Japanese central bank maintained the generally accommodative stance of its monetary policy and announced at the end of July that it would keep the interest rate level low for an extended period of time.

## United Kingdom

The cyclical upswing in the United Kingdom has picked up steam again. After adjustment for the usual seasonal variations, real GDP in the second quarter was up by 0.4% from the previous period, in which it had risen by only 0.2%. This stronger increase was primarily due to the distinct upturn in the services sector. This was particularly true for areas which had been

*Economic activity strengthening*

*Return to growth*

<sup>5</sup> See Deutsche Bundesbank, The potential macroeconomic impact of US tax reform, Monthly Report, February 2018, pp 14-16.

<sup>6</sup> The sharp upsurge may to some extent reflect Chinese buyers' advance purchases of soybeans, which have been subject to higher import duties since July. However, regional data from the trade statistics suggest that, in the second quarter, agricultural products from the United States sold well in other parts of the world, too.

<sup>7</sup> Prior to the most recent comprehensive revision of the national accounts, the data had depicted a steep downward trend in the rate of saving since the beginning of 2016. However, the figure for the first quarter of 2018 was revised upwards by nearly 4 percentage points.

especially affected by the unusually harsh weather conditions at the start of the year according to the British Office for National Statistics. This picture is supported by the fact that construction output recovered from its decline in winter. On the other hand, manufacturing output contracted noticeably. The labour market continued to remain resilient, with the unemployment rate in the quarter ended falling to 4.0%, its lowest level since the winter of 1975. The Harmonised Index of Consumer Prices (HICP) rose in June by 2.4% on the year, as in the previous month. At the beginning of August, the Bank of England raised its policy rate by 25 basis points to 0.75%, also in light of the strengthening economy.

## New EU member states

*Continued upswing with rising consumer prices*

In the new EU member states (EU-6),<sup>8</sup> the economic upswing continued in the second quarter of 2018 as well. Real GDP, after adjustment for seasonal variations, rose sharply compared to the previous quarter in most countries. Vigorous industrial activity contributed to this; in the second quarter industrial production in these countries exceeded the level of the first quarter by 1.8%. On the expenditure side, economic growth has still been primarily borne by persistently robust private consumption, which was buoyed up by the continued improvement in the labour market situation. The unemployment rate decreased by 1.0 percentage point on the year in the second quarter, reaching a new low at 4.1%. Consumer price inflation rose in the second quarter to 2.1% on the year, due mainly to higher energy prices. However, the sustained sharp growth in wages has, to date, barely been reflected in the core components of the HICP. Excluding energy and food, consumer prices were up by only 0.8% in the second quarter. Headline HICP rates ranged from 1.1% in Poland to 2.1% in the Czech Republic and 2.8% in Hungary through to 4.5% in Romania. Against the backdrop of sharply rising prices, the central banks of Romania and the Czech Republic raised their

policy rates in May and June, respectively; the Czech central bank raised rates again in August.

## Macroeconomic trends in the euro area

The economic upturn in the euro area continued in the second quarter of 2018 at the same pace as in the preceding quarter. According to Eurostat's flash estimate, real GDP in the second quarter was up after seasonal adjustment by 0.4% on the quarter, and by 2.2% on the year. This firmly established the picture of a slowdown in economic growth compared to the growth rates observed in the previous year. Economic output is no longer likely to have increased much faster than capacity in the first half of 2018. This was mainly due to the reduced momentum in foreign business. In the mean time, there had been expectations of a normalisation after exports had once again risen exceptionally sharply in the second half of 2017 (see box on pages 16 and 17). By contrast, domestic activity proved to be robust in the first half of 2018. Aggregate capacity utilisation remained strong, and sentiment among enterprises and consumers was still confident despite some deterioration, suggesting that the forces fuelling economic activity are still intact.

*Continued moderate upturn*

Private consumption is likely to have lost some momentum in the second quarter. While retail sales went up after price and seasonal adjustment, there was a decline in new motor vehicle registrations. The sharp increase in consumer prices caused largely by oil prices is likely to have had a negative impact on households' propensity to purchase. This noticeably dampened the increase in real disposable income. By contrast, consumption growth benefited from persistently favourable consumer sentiment and the continuing improvements in the labour market.

*Private consumption somewhat less buoyant*

<sup>8</sup> This group comprises the non-euro area countries that have joined the EU since 2004, ie Poland, the Czech Republic, Hungary, Bulgaria, Romania and Croatia.

## Recent developments in euro area export activity

In the first quarter of 2018, euro area exports of goods and services as defined in the national accounts declined markedly after seasonal adjustment, following a very strong rise particularly towards the end of the past year. Monthly data from the foreign trade statistics for goods exports to non-euro area countries (extra-euro area exports) show a similar picture. Even though global economic activity has remained quite lively, data for the second quarter do not yet promise any improvement. It seems to make sense to attribute the slump in exports at least in part to the past euro appreciation. After all, the euro has experienced a significant trend appreciation since early 2017.

In order to identify the determinants of export developments in the first half of 2018, an error correction model is estimated.<sup>1</sup> The econometric model assumes a stable long-run relationship between exports,<sup>2</sup> the real effective exchange rate of the euro and foreign demand. Deviations from the long-run equilibrium diminish in subsequent periods ("error correction"). The estimation comprises the period from the first quarter of 2000 to the second quarter of 2018. The euro's real effective exchange rate is measured against the 38 most important trading partners and is based on consumer prices.<sup>3</sup> Foreign demand is approximated using the weighted average of import volumes of the euro area's trading partners.<sup>4</sup> Given the lack of current data, this analysis uses the simplifying assumption that foreign demand in the second quarter of 2018 grew at the same rate as at the beginning of the year. The estimated model can explain around 80% of the variation in extra-euro area exports. The estimated coefficients have the expected sign,

and the existence of a long-run relationship between the variables is confirmed. The deviation of exports from their long-run level is reduced for the subsequent period by around one-fifth, according to the estimation results.

On the basis of this estimation, dynamic simulations can be used to calculate the contributions made by the exchange rate and foreign demand to export developments. It turns out that, according to the model, the euro's appreciation distinctly dampened euro area exports in the last few quarters. What the decomposition also shows, though, is that the retarding effects of the appreciation in the past year were offset by particularly strong growth in foreign demand. Although the latter subsided markedly at the beginning of 2018, the positive stimuli generated by foreign demand still outweighed the damp-

---

<sup>1</sup> For more on this, see also M Ca' Zorzi and B Schnatz (2010), Explaining and forecasting euro area exports: Which competitiveness indicator performs best?, in P De Grauwe (ed), Dimensions of competitiveness, MIT Press, pp 121-148.

<sup>2</sup> This is based on quarterly, seasonally adjusted nominal exports of goods to non-euro area countries, price-adjusted with the producer price index for exports of goods from the euro area to non-euro area countries, taken from the foreign trade statistics.

<sup>3</sup> The results remain largely unchanged if an indicator based on deflators of total sales is used. In order to obtain the most up-to-date data possible for a broad group of countries, the results are shown here for an indicator based on consumer prices, even if a cross-country empirical study of the suitability of various measures of the real exchange rate (see Deutsche Bundesbank, The impact of alternative indicators of price competitiveness on real exports of goods and services, Monthly Report, January 2016, pp 13-29) leans towards using the indicator based on deflators of total sales.

<sup>4</sup> Such a time series is calculated as part of the preparation of macroeconomic projections for the euro area by the staff of the European Central Bank (ECB). For more detailed information concerning the methodology, see K Hubrich and T Karlsson (2010), Trade consistency in the context of the Eurosystem projection exercises, ECB Occasional Paper No 108.

ening effects of the euro's appreciation. It must be noted, moreover, that exports picked up more strongly in the second half of 2017 than predicted by the model. At the beginning of 2018, however, this development reversed itself, with the positive residuals of the second half of 2017 counterbalanced by a considerable negative residual in the first quarter of 2018. In the second quarter, too, part of the poor export performance is likely to have remained unexplained. Although the earlier appreciation of the euro continued to weigh on exports, this retarding effect has subsided. In addition, foreign demand is likely to have once again generated positive stimuli.

Moreover, there also arises the question as to how to frame the slump in exports in the first half of 2018 over a longer-term view. To that end, a hypothetical equilibrium path of exports is calculated from the estimated long-run relationship, taking into account actual exchange rate and foreign demand patterns. In the final quarter of 2017, this path remained well below the actual volume of extra-euro area exports. What this means is that, in the first quarter of 2018, the estimated error correction mechanism had a dampening effect within the model's framework. The unexplained negative residual could also be a sign that export volume adjusted more quickly to the long-run equilibrium value than on average in the quarters underlying the estimation. This development could have continued in the second quarter. All the same, export volume probably still surpassed the estimated equilibrium value.

In the framework of this model simulation, the decline in euro area exports at the beginning of the year is not a worrying slump but only part of a process of normalisation following an exceptionally favourable devel-

opment. Euro area exports can thus be expected to rebound soon provided the global economic environment remains robust.

ant than exports, in keeping with the robust domestic economy.

Following a weak preceding quarter, industrial production moved onto a sideways trajectory, remaining at virtually the same level in the second quarter as in the first after seasonal adjustment. While energy production fell sharply, a distinctly higher volume of consumer goods were manufactured. By contrast, the production of intermediate goods and capital goods remained largely unchanged.

*Industrial production virtually unchanged*

The picture in most member states has been shaped by the moderately upward-moving underlying cyclical trend, although GDP growth continued to be strong in some, generally smaller, countries. In France, real GDP rose by just 0.2% on the quarter after seasonal adjustment, as it had at the start of the year. Private consumption was down slightly after having increased only marginally in the first quarter. In addition to higher consumer prices, the tax measures that took effect at the beginning of the year were probably also a factor in the weak consumption dynamics. Investment increased visibly, and there was a noticeable build-up of inventories. This is likely to be related to the fact that imports rose much more sharply than exports. Aggregate output in Italy also experienced only muted growth. In the second quarter, seasonally adjusted real GDP was up by 0.2% following 0.3% in the preceding quarter. Despite the rather sharp increase in employment, private consumption rose only moderately. This is at least what is suggested by the weak growth in retail and new motor vehicle registrations. There was probably a small increase in investment in machinery and equipment, while construction investment is likely to have once again been trending sideways. Foreign business is unlikely to have provided much of a growth stimulus. Italy's exports of goods were up only slightly in the second quarter after adjustment for seasonal and price variations. Spain experienced the strongest growth among the major member states, although quarterly GDP growth fell from

*Moderate economic growth in most countries*

*Increased investment*

The pace of investment activity is likely to have picked up in the second quarter. Following the drop in the previous quarter, price-adjusted spending on machinery and equipment is set to have rebounded. Positive impetus probably also came once again from investment in buildings, as the rise in construction output compared to the previous period suggests.

*Muted growth in exports*

Spring 2018 saw no more than a subdued countermovement in exports following a decline in the first quarter. Trade between euro area member states rose substantially on the quarter, and business with non-euro area countries also improved. The distinct rise in export prices, however, meant that there was no increase in the volume of exports to countries outside the euro area. Delayed dragging effects from the appreciation of the euro and normalisation after an especially vibrant second half of 2017 were probably major factors in this. Imports likely proved to be somewhat more buoy-

0.7% to 0.6% in the second quarter. Economic growth was driven primarily by the sharp expansion of investment, while private consumption lost momentum, and exports even declined markedly. GDP also increased strongly in the Netherlands, and economic growth in Austria, Finland and Portugal was also quite considerable. Belgium reported only moderate growth.

*Ongoing improvement in the labour market*

Labour market conditions continued to improve in the second quarter. The number of unemployed people in the second quarter fell by 345,000 compared to the first quarter of 2018, after seasonal adjustment, and by around 1.2 million on the year. The standardised unemployment rate in June fell to 8.3%, after 8.5% in March and 9.0% in June one year earlier. Employment figures for the first quarter show a persistently strong increase in employment, even if that growth is somewhat lower than in the final quarter of 2017. The number of employed persons was up on the year by 2.2 million, or 1.4%, while wage growth accelerated perceptibly. Given an unchanged number of average hours worked, the year-on-year rise in gross hourly earnings accelerated by 0.4 percentage point to 2.0% in the first quarter compared to the final quarter of 2017. Growth in hourly employee compensation rose to 1.9% over the same period.

*Consumer prices up distinctly again in spring*

Consumer prices were up by a seasonally adjusted 0.6% in the spring of 2018, indicating another considerable increase. As in the final quarter of 2017 and in the first quarter of 2018, energy prices were raised significantly on the back of higher crude oil prices. In addition, food prices went up distinctly, as did prices for services. By contrast, the prices for non-energy industrial goods continued to rise moderately. Annual headline HICP inflation increased markedly from 1.3% to 1.7%. The absence of base effects, particularly in unprocessed food, the price of which had been especially high at the start of 2017 on account of the weather, was also a factor.

Deutsche Bundesbank

### Contributions to the euro area inflation rate (HICP)

Percentage points, quarterly averages

Sources: Eurostat and the ECB.

Deutsche Bundesbank

*Core inflation  
stable at  
around 1%*

Excluding energy and food, consumer prices increased by 0.9% on the year in the second quarter, which is much the same as in the previous two quarters. Services once again accounted for the largest contribution to core inflation, while that of non-energy industrial goods was more on the low side. This was not only due to the greater weight of services in the HICP basket of goods (44% compared with 26% for non-energy industrial goods) but also to the generally stronger price dynamics.

*Further rise in  
consumer prices  
in July*

In July, consumer prices continued to increase in seasonally adjusted terms. Energy prices were up again significantly, while the prices of other products also rose somewhat. Accordingly, overall annual headline HICP inflation and annual HICP inflation excluding energy and food increased to 2.1% and 1.1% respectively.

The unabatedly positive sentiment among enterprises and consumers suggests that the economic upturn in the euro area will continue. Though the Purchasing Managers' Index for the whole economy dropped a little in July following a rise in June, it still far exceeded the expansion threshold. The European Commission's indicator of business and consumer sentiment remained virtually unchanged at a relatively high level. On the whole, major driving forces behind the euro area's economy remain intact. These include favourable financing conditions, the improved state of the labour market and the expanding global economy. External risks to economic growth arise primarily from protectionist tendencies, while internal risks arise from the movement away from crucial structural reforms as well as uncertain government setups in some member states.

*Economic  
activity likely to  
remain robust*

## Monetary policy and banking business

### Monetary policy and money market developments

*ECB Governing Council announces anticipated end of net asset purchases*

In the light of further progress towards a sustained adjustment in the path of inflation to the medium-term target, the Governing Council of the ECB made a number of decisions regarding non-standard monetary policy measures and key interest rates at its meeting in June. As already announced, the purchases under the expanded asset purchase programme (APP) will continue at a monthly pace of €30 billion net until the end of September 2018. Moreover, subject to incoming data confirming the Governing Council's medium-term inflation outlook, it is now looking at reducing the net volume of monthly asset purchases to €15 billion after the end of September 2018 and discontinuing purchases entirely after the end of December 2018. The Governing Council still intends to maintain its policy of reinvesting the principal payments for an extended period of time after the end of the net purchases, and in any case for as long as necessary to maintain favourable liquidity conditions and an ample degree of monetary accommodation.

*ECB Governing Council strengthens forward guidance on key interest rates*

The Governing Council of the ECB kept the key interest rates unchanged in the reporting period. The main refinancing rate thus remains at 0%, while the marginal lending rate stands at 0.25% and the deposit facility rate at -0.40%. At the same time, the ECB Governing Council strengthened its forward guidance on the future development of key interest rates following its June meeting. It now anticipates that policy rates will remain at their present levels at least through the summer of 2019, and in any case for as long as necessary to ensure the continued sustained convergence of inflation to levels that are below, but close to, 2% over the medium term.

The ECB Governing Council based its decision to probably terminate net asset purchases after

December 2018 on the conclusion that progress towards a sustained adjustment in the path of inflation has been considerable. The Governing Council believes that the underlying strength of the euro area economy and well-anchored inflation expectations provide grounds to be confident that the convergence of inflation towards levels below, but close to, 2% in the medium term will continue in the near future as well as after the reduction and discontinuation of the net purchases. Even so, it believes that a significant degree of monetary policy accommodation is still needed to support the build-up of domestic price pressures and headline inflation developments over the medium term. The decisions taken will ensure that this monetary policy support is maintained. Following the July meeting, the Governing Council recently confirmed that, despite uncertainties related to global factors, the data avail-

*Substantial progress towards sustained adjustment in inflation*

## Money market management and liquidity needs

The two reserve maintenance periods between 3 May 2018 and 31 July 2018 saw a marked increase in euro area liquidity needs stemming from autonomous factors (see the table below). Averaging €1,345.7 billion in the June-July 2018 reserve period, these needs were €70.7 billion up on their average level in the March-May 2018 reserve period. In year-on-year terms, ie compared with the June-July 2017 reserve period, this even translated into an increase of around €257 billion. Overall, the sum of the autonomous factors fluctuated within a broad corridor of between €1,233.3 billion and €1,386.7 billion in the two reserve maintenance periods under review. The above-mentioned average increase in liquidity needs of €70.7 billion arose, in particular, from the aggregate decline in net foreign assets and other factors. These autonomous factors, which are considered together because of liquidity-neutral valuation effects, contracted by €30.2 billion in net terms. Moreover, compared with the figures for the

March-May 2018 period, increases in banknotes in circulation and government deposits with the Eurosystem, by €24.6 billion and €15.9 billion respectively, each helped to push up the calculated liquidity needs. Coming in at an average of €1,183.6 billion (the value of Eurosystem banknotes in circulation) and €263.4 billion (the volume of government deposits), both autonomous factors recorded sizeable stock levels in the June-July 2018 maintenance period. The minimum reserve requirement stood at €124.7 billion in the same period.

During the reporting period, market participants demonstrated a particular interest in the first voluntary early repayments of the first operation belonging to the second series of targeted longer-term refinancing operations (TLTROsII). However, the credit institutions only took limited advantage of this option. A total of no more than €11.0 billion of the previously outstanding €396.0 billion under this

Deutsche Bundesbank

tender had been repaid at the end of June. Owing to the attractive conditions offered by the TLTROsII – depending on the lending behaviour of a given credit institution, that institution's interest rate can, in a best-case scenario, mirror the deposit facility rate of -0.40% – market players had already anticipated a modest level of repayment in advance. The total outstanding amount for all four TLTROsII now stands at around €726 billion. Furthermore, in June, banks also had the option of voluntarily repaying four TLTROI operations prior to maturity, with actual use of this facility amounting to €3.5 billion in total. The outstanding, relatively low volumes pertaining to the eight TLTROI operations and totalling €8.9 billion are scheduled to mature at the end of September 2018, at which time there will once again also be early repayment options for the TLTROsII. During the period under review, the outstanding tender volume was largely determined by the aforementioned repayments; in the June-July 2018 reserve period, it averaged around €746 billion, putting it just over €15 billion below the average figure for the March-May 2018 period. Of this tender volume, a relatively small proportion was again accounted for by the three-month tenders and the main refinancing operations, which recorded average volumes of €7.2 billion and €2.1 billion respectively in the June-July 2018 reserve period. This represented only a slight change compared with the March-May 2018 reserve period, in which they had posted average volumes of €7.7 billion and €1.9 billion respectively (see the chart on page 25).

The Eurosystem continued to provide the bulk of central bank liquidity through the monetary policy asset purchase programmes (see the adjacent table), which accounted for just over three-quarters of the liquidity provided via the open market operations, according to the average figures for the June-July 2018 reserve period. The average balance sheet holdings of all purchase programmes in this period stood at €2,558 billion, €82 billion above the corresponding average holdings recorded for the May-March 2018 reserve period.

CBPP2	- 0.3	4.0

Deutsche Bundesbank

Despite this injection of liquidity, the level of excess liquidity declined slightly on balance in the period under review. At an average volume of €1,834 billion in the June-July 2018 reserve period, it was just under €5 billion below its level in the March-May 2018 period, notwithstanding a slight hike in the May-June 2018 average for a time to a figure of €1,851 billion. This represented a continuation of the trend evident since the end of last year that saw excess liquidity cease to grow by any sig-

### Liquidity provision and use

€ billion, daily data

Deutsche Bundesbank

nificant margin, or even shrink, primarily because of greater liquidity needs stemming from autonomous factors (see the above chart).

Thanks to the ongoing prevalence of extremely comfortable liquidity conditions, overnight rates continued to be geared towards the deposit facility rate (see the chart on page 23). In the May-June 2018 and June-July 2018 reserve periods, Eonia averaged -0.36% and thus remained above the deposit facility rate. Throughout the period under review, Eonia fluctuated between -0.37% and -0.35%. The Eonia volumes reported for unsecured overnight money once again contracted, generating an average daily turnover of €4.6 billion in the June-July 2018 reserve period and €3.2 billion in the previous period. The volume concerned had averaged €5.6 billion in the March-May 2018 reserve period. Meanwhile, in the period under review, secured overnight money in GC Pooling traded at an average of -0.44% in the ECB basket. This resulted in an average rate that was one basis point above the previous review period and that continued

to trade below the deposit facility rate. Overnight money in the ECB EXTended basket, with its larger set of eligible securities, traded at -0.40% on average in the May-June 2018 reserve period and at -0.39% in the June-July 2018 reserve period. Compared with previous periods and the same period of the preceding year, at an average of €7.1 billion, the underlying GC Pooling Overnight turnover in the two baskets was up in overall terms. In this context, at an average level of €7.6 billion, turnover in the June-July 2018 reserve period was once again higher than in the previous period, when it had averaged €6.6 billion. The trading volume had stood at an average level of €5.9 billion in the March-May 2018 reserve period. The end of the half-year period at the close of June 2018 again had an impact on overnight rates and their associated turnover. While Eonia was found to be up on the day by one basis point, secured overnight money in the EXT basket was trading two basis points lower at a rate of -0.46%. Reduced turnover was observed for unsecured and secured overnight money alike.

able in the meantime still point to solid and broad-based economic growth in the euro area.

On 10 August, the Eurosystem's asset holdings under the APP came to €2,496.3 billion. At €2,046.1 billion, the largest share of this by far was attributable to securities holdings under the public sector purchase programme (PSPP). At last count, the average residual maturity of the PSPP portfolio remained unchanged at 7.6 years. The outstanding amounts acquired to date under the third covered bond purchase programme (CBPP3) and the asset-backed securities purchase programme (ABSPP) came to €256.7 billion and €27.8 billion respectively. Holdings under the corporate sector purchase programme (CSPP) totalled €165.7 billion as at 10 August.

On 27 June, credit institutions had their first chance to use the voluntary repayment option for the first operation of the second series of

targeted longer-term refinancing operations (TLTROs II). A total of 41 institutions paid back loans totalling around €11 billion to the Eurosystem, which was only a relatively small proportion of the outstanding tender volume of just under €400 billion. The attractive interest rates that apply to the entire maturity of the TLTRO II are probably one of the major reasons why early repayments were not higher.

Excess liquidity fell slightly in the period under review, declining by a total of €4 billion to €1,909 billion. From as early as the end of last year, the volume of excess liquidity has no longer risen significantly, but has instead moved within a certain range depending on fluctuations in the autonomous factors. Here, trend growth in the autonomous factors is partially offsetting the additional liquidity provided by means of the monthly net purchases under the APP, which have been reduced to €30 billion since January 2018.

*Purchase volumes still in line with announced target*

*41 banks repay €11 billion from the first TLTRO II operation*

*Excess liquidity shows slight decline*

*Money market interest rates virtually unchanged overall*

During the period under review, the unsecured overnight money market rate (Eonia) continued to move within a narrow range of between -0.35% and -0.37%, and the secured overnight rate (STOXXGC Pooling) remained in a range below the deposit rate of -0.40%. The three-month Euribor went up marginally in the reporting period, standing at -0.32% at last report.

*Shift in expected date of first key interest rate hike*

In the first few days after the ECB Governing Council's June meeting, the money market forward rates derived from the Eonia swap curve went down markedly. At present, an increase in the deposit facility rate – depending on the assumed size of the first interest rate hike – is not factored into forward rates until the period from the fourth quarter of 2019 to the second quarter of 2020, which is much later than anticipated before the June meeting.<sup>1</sup> This delay of more than one quarter should probably partly be interpreted as a market response to the stronger forward guidance on key interest rates. However, money market rates are not solely a reflection of interest rate expectations, but also include term premiums, which may change in response to incoming economic data.<sup>2</sup> Survey-based measures, which exclusively capture interest rate expectations, also showed a postponement of interest rate hike expectations following the June meeting; however, they point to September 2019 as the date for the first key interest rate hike, which is sooner than the dates derived from the money market forward rates. If money market forward rates are adjusted for term premiums, which are currently estimated to be negative,<sup>3</sup> the interest rate path derived from this is closer to the survey results and thus also closer to the date-based element of the stronger forward guidance, which suggests that key interest rates will remain unchanged “at least through the summer of 2019”.

## Monetary developments in the euro area

Following two significantly weaker quarters, growth in the broad monetary aggregate M3 in the spring months returned closer to the robust developments of the previous year. The reduction in the monthly volume of asset purchases by the Eurosystem under the APP since the beginning of the year has therefore not led to a sustained downward trend in monetary growth as yet. This was mainly due to a pick-up in lending to the private sector. With economic growth continuing to be sound, both loans to non-financial corporations and loans to households again posted significant inflows. The increasingly lively demand for credit in the euro area was also bolstered by the interest rate environment. Furthermore, the results of the latest Bank Lending Survey (BLS) indicate that euro area banks continued to ease their credit standards in all loan segments in the second quarter.

*Credit growth still reflected in monetary dynamics*

Monetary growth during the reporting period was again dominated by the increase in overnight deposits, which rose again significantly after two weaker quarters. Furthermore, the increase in other short-term deposits was also relatively robust. Looking at the sectors, households, in particular, stepped up their use of savings deposits as well as overnight deposits,

*Increase in overnight deposits dominant factor in M3 growth*

<sup>1</sup> Plausible estimates as to how large the first interest rate hike might be can be derived from surveys on interest rate expectations and range from 10 to 25 basis points.

<sup>2</sup> The term premiums for money market forward rates are currently negative according to model estimates. This can be explained by the fact that market participants are willing to accept a yield discount in order to hedge against (adverse) scenarios in which interest rates remain low for longer than expected.

<sup>3</sup> This type of adjustment is carried out using a term structure model, which breaks down the path followed by money market forward rates into the path followed by the exclusive interest rate expectations and the risk premiums. It shows that, at present, the most likely interest rate path generated by the model, adjusted for risk premiums, is closer to the survey results. For more detailed information on the extraction of interest rate expectations at the lower bound, see F Geiger and G Schupp, With a little help from my friends: Survey-based derivation of euro area short rate expectations at the effective lower bound, Deutsche Bundesbank Discussion Paper No 27/2018.

Deutsche Bundesbank

thus continuing the trend, observed for some time now, of risk-averse investors' preference for deposits with the shortest possible maturities in the face of persistently low interest rate spreads between deposit types. By contrast, non-monetary financial corporations increasingly accumulated short-term time deposits in the quarter under review. However, the extent to which they did so varied widely between the different euro area countries (for more information on developments in Germany, see also pages 30 to 31). On balance, the annual growth rate of M3 at the end of the quarter rose to 4.4%, thus edging back up towards the 5% mark around which it had hovered in 2016 and 2017.

Of the counterparts, lending by the MFI sector to the private non-MFI sector in the euro area was again the main driver of monetary growth in the second quarter of 2018. The corresponding contribution to M3 growth compared to the previous year increased from 2.8 to 3.3 percentage points, primarily off the back of more dynamic lending to non-financial corporations. Adjusted for securitisations and other one-off effects, its annual growth rate rose to 4.1% in the second quarter, putting it around 2 percentage points higher than a year earlier.<sup>4</sup> The significant growth in demand for loans was driven by the favourable financing conditions,

as well as the continued economic upturn involving, in particular, a substantial increase in investment in machinery and equipment in many euro area countries. In a cross-country comparison, the main growth stimuli for loans to non-financial corporations continued to emanate from Germany and France. However, in the last few quarters, lending in a number of smaller core countries, as well as in Italy and Spain – albeit to a smaller degree – also contributed to the euro area aggregate (see the chart on page 29).

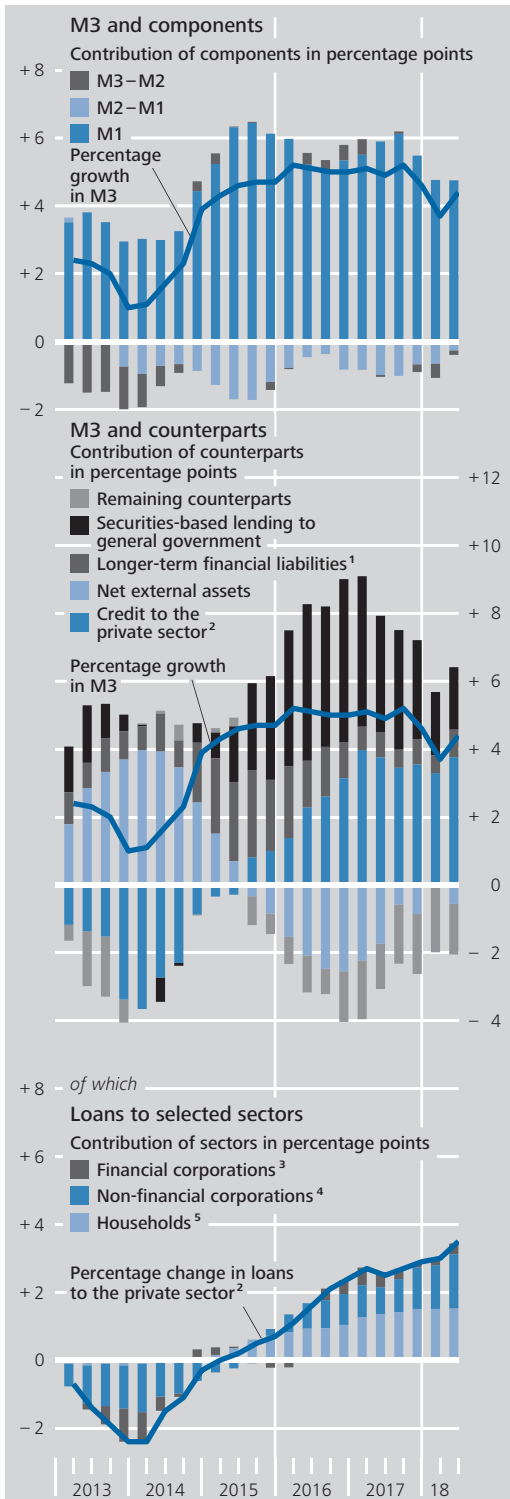

This is consistent with the banks surveyed as part of the BLS reporting a marked increase in the demand for loans by non-financial corporations in the euro area as a whole in the second quarter. The dynamic developments reported in the recent survey rounds thus continued. Besides citing the low general level of interest rates as the main factor, bank managers also attributed the increase in demand to, amongst other things, a rise in financing needs for inventories and working capital, fixed investment

<sup>4</sup> In the second quarter of 2017, a one-off special effect in June dragged down the annual growth rate of loans to non-financial corporations in the euro area, but did not have a lasting effect on loan developments (see also Monetary developments in the euro area: June 2017, ECB press release dated 27 July 2017). The corresponding annual growth rates in the first and the third quarters of 2017 were 2.4% and 2.5% respectively.

*Loans to non-financial corporations main driver of credit growth, ...*

Deutsche Bundesbank

as well as for mergers, acquisitions and restructuring. By contrast, enterprises' use of internal financing as well as lending by non-banks had a dampening effect on demand when taken in isolation, as in earlier surveys.

Given what remains a very expansionary monetary policy and fierce competition between banks, financing conditions were still extremely favourable. On the one hand, interest rates for loans to enterprises throughout the euro area were once again close to historical lows in the reporting quarter. On the other, the banks surveyed as part of the BLS reported a further easing of credit standards. They stated that, on balance, they had continued to ease their credit standards and credit terms and conditions for loans to enterprises at the euro area aggregate level in the reporting quarter.

In the quarter under review, loans to households in the euro area likewise experienced distinct growth. Banks from Germany, France and Italy were the main contributors to the fairly stable year-on-year growth of just under 3% over the last few quarters. Loans for house purchase were once again the driving force of growth, increasing slightly more markedly than in the previous quarter. This is consistent with the fact that the banks surveyed in the BLS reported a significant increase in demand for housing loans. According to the bank managers, the rise in the need for funds was mainly due to the low general interest rate level, but also to households' continued upbeat assessment of housing market prospects and stable consumer confidence. Institutions reported minor dampening effects on demand, mainly resulting from the internal financing of house purchases out of savings, as well as from lending by competitor institutions.

Banks' lending policies remained expansionary in this loan segment as well. On balance, credit standards in this segment were eased moderately in the reporting quarter. In addition, the surveyed banks were more accommodating with their credit terms and conditions and fur-

*... also supported by further easing of banks' lending policies*

*Continued growth in loans to households again driven by loans for house purchase, ...*

*... likewise supported by expansionary credit standards, ...*

ther reduced the margins for average-risk loans, in particular. According to what the surveyed institutions reported, this essentially occurred – as in the previous quarters – against the backdrop of the high level of competition in the banking and non-banking sectors and a better assessment of the risks associated with loans extended by credit institutions.

*... but also by continued strong growth in consumer credit*

Consumer credit growth stayed strong in the reporting quarter and, at an annual growth rate of 7.0% at the end of June, remained the fastest growing component of loans to households. In bank-supply-side terms, this was supported by the fact that the banks surveyed in the BLS on balance again marginally eased their credit standards in this loan segment as well. According to the surveyed euro area banks, the demand for consumer credit and other loans gained even more momentum compared with the last six quarters. Respondents put the higher demand down to robust consumer confidence, the low general level of interest rates, and the high propensity to purchase. The latter was further bolstered in the reporting quarter by the sound economic growth and the steady improvement in the labour market.

*Expansion of securities-based lending, in particular by the Eurosystem, represents an additional pillar of M3 growth*

Besides loans, securities-based lending to general government and private enterprises in the euro area represented a key pillar of M3 growth in the reporting quarter (see adjacent chart). Growth was again driven by the Eurosystem's monthly net asset purchases under the APP. Given the renewed scale-back of these monetary policy purchases in January 2018, however, growth in the first half of 2018 was markedly weaker than in the period from 2015 to 2017. Another factor behind the increase in securities-based lending was that the commercial banking sector on balance substantially expanded its stock of debt securities issued by the private sector in the reporting quarter.

Another positive contribution to monetary growth came from the decline in other liabilities of the MFI sector. Monetary capital, in par-

Unlike the overall volume of contracts (ie deposit contracts on the balance sheet at the end of the month), the volume of new business (ie all contracts concluded in the course of a month) is explicitly recorded for time deposits only.

Deutsche Bundesbank

*Net external asset position has a per se dampening effect on monetary growth*

By contrast, the MFI sector's net external asset position curbed monetary growth in the quarter under review. This counterpart consequently experienced a degree of volatility comparable to that of recent quarters. According to the balance of payments data for April and May available thus far, the outflow of funds was attributable to the current account surplus of the euro area being more than offset by a higher negative financial account balance. Non-resident investors sold euro area assets on balance in April and May, whereas domestic non-banks continued to purchase foreign securities. Amongst other things, these capital flows are likely to be linked to the temporarily

heightened political uncertainty in parts of the euro area, as well as to the statements by the Governing Council of the ECB on the future development of key interest rates, which were perceived as being accommodative.

## German banks' deposit and lending business with domestic customers

German banks' deposit business with domestic customers remained positive in the second quarter and was even more buoyant than in previous quarters. Short-term types of deposit remained popular among investors. Thus, overnight deposits once again recorded significant growth between April and June. At the same time, unlike in the previous quarters, short-term time deposits remunerated at close-to-market rates also expanded markedly once more. The persistently high preference of the money-holding sectors for short-term bank deposits still needs to be seen in conjunction with the historically low yield premium on longer-term bank deposits (see adjacent chart).

*Deposit growth still dominated by build-up of overnight deposits*

Households again contributed the bulk of the increase in overnight deposits. Non-financial corporations, too, again perceptibly scaled up their overnight deposits in the reporting quarter, even though remuneration on these deposits has been in negative territory for several quarters and fell slightly again of late. Besides the interest rate constellation, the persistently high levels of interest shown by these sectors in highly liquid bank deposits is likely to have been boosted by the declining yields on riskier forms of investment in recent quarters (see the box on pages 32-34).

*Largest contribution once again from private non-financial sector*

Moreover, the financial corporations sector, which traditionally has a greater interest in seeking higher returns, saw an increase in bank deposits during the period under review. However, the investment behaviour of individual financial agents remained very heterogeneous in the quarter under review as well. While in-

*Investment behaviour within the financial corporate sector remains very heterogeneous*

urers and pension funds continued to reduce their long-term bank deposits during the reporting period – a process observed since mid-2009 – other financial corporations built up their short-term time deposits significantly. This development was likely due, in part, to the expectation of rising interest rates and the associated interest rate uncertainty, which, taken in isolation, favoured the temporary parking of funds in the form of liquid bank deposits.

*Lending business with domestic non-banks expanded further, driven by the private sector*

Banks' lending business with the domestic non-bank sector was exceptionally dynamic in the reporting quarter. This was mainly due to loans to the domestic private sector growing strongly as well as to the fact that banks once again distinctly increased their holdings of securities issued by the private sector. In contrast to the previous year, banks purchased fewer equity and investment fund shares; instead, they increasingly acquired debt securities. This development was once again counterbalanced by lending to the public sector. In view of the very favourable budgetary situation, loans to this sector declined for the eleventh consecutive quarter. In addition, banks (again) reduced their net holdings of government bonds.

*Non-financial corporations show greater interest in bank loans*

The largest net inflows in loans to the private sector in the quarter under review were recorded for loans to non-financial corporations. In line with the positive impetus from private consumption and rising levels of fixed investment, domestic enterprises again showed strong interest in bank loans; this meant that the increase in demand for this form of financing observed since the beginning of 2017 continued. The annual growth rate for loans came to 5.9% at the end of the quarter under review – a level higher in this credit segment than at any time since the end of 2008.

The latest expansion occurred across all maturities, most notably for loans with a maturity of more than one year. This development suggests that German enterprises continued more strongly to finance their short-term expenditure

with their own funds. At the same time, enterprises' demand for loans with longer maturities is likely to have been supported by the desire to lock in interest rates. Although interest rates for longer-term loans to enterprises have remained at a very low level, there has been a slight trend increase in the past few months (see the chart on page 36).

The latest BLS results provide additional information on the underlying demand factors in Germany. According to the bank managers, the increase in demand was fuelled not only by the low general level of interest rates but, above all, by higher financing needs for fixed invest-

*Lending policies eased for loans to enterprises*

## Developments in the real portfolio returns of households in Germany

Interest rates on bank deposits in Germany remain at a historically low level. Taken in isolation, this is depressing the return accruing to households from their financial asset holdings. That being said, aside from bank deposits, German households also have holdings in the form of securities and claims on insurance corporations, and the returns on these therefore also need to be taken into account. For instance, developments in the total return on financial assets in this sector are influenced not just by deposit rates but also, and in particular, by returns on claims on insurance corporations as well as price effects and dividend payouts on securities. This box details the path of returns on various types of financial asset and the total return up to the current end as defined by the available data (the first quarter of 2018), thus carrying on from past calculations.<sup>1</sup> In this context, there is merit

in viewing generated returns in real terms, as the purchasing power of nominal returns fluctuates in line with inflation.<sup>2</sup>

The chart below shows the evolution of real returns on the main types of financial asset in the portfolio of households in Germany between 1991 and the first quarter of 2018.

<sup>1</sup> For details, see Deutsche Bundesbank, Investment behaviour in the low-interest-rate environment, Annual Report 2017, pp 16-18; Deutsche Bundesbank, Real portfolio returns of households in Germany, Monthly Report, August 2017, pp 31-33; and Deutsche Bundesbank, German households' saving and investment behaviour in light of the low-interest-rate environment, Monthly Report, October 2015, pp 13-31.

<sup>2</sup> In addition, it is also possible to view this after tax, leading to qualitatively similar results. However, compensation for inflation, being a component of nominal interest, has customarily been taxed more heavily, particularly in the past. See also Deutsche Bundesbank, Return on private financial assets taking into account inflation and taxes, Monthly Report, July 2017, pp 69-75.

Real returns on various types of financial asset held by households in Germany

% pa, annually/quarterly

Sources: Assekurata, German Insurance Association (Gesamtverband der Deutschen Versicherungswirtschaft) and Bundesbank calculations. <sup>1</sup> Data on the annual return on investment fund shares are only available as from 1995 Q4. <sup>2</sup> Nominal deposit interest rates are based on the Bundesbank's interest rate statistics until 2002 and on the harmonised MFI interest rate statistics as from 2003. The period prior to 2003 and the years from 2003 onwards can therefore only be compared to a limited degree.

### Contribution of individual types of financial asset\* to the real total return of households in Germany

Percentage points, annually / quarterly

\* Weighted according to share of total financial assets.  
 Deutsche Bundesbank

For much of that time, bank deposits (including currency) which, at just under 40%, consistently constituted the bulk of the portfolio, yielded the lowest real returns; these slipped into clearly negative territory, most notably since the middle of 2016. Moreover, since the beginning of 2017, the real return on insurance claims dipped to a particularly low level, with returns on securities, which tend to be comparatively volatile, likewise heading downward of late. This was initially driven by dwindling price gains in the capital market compounded by heavy losses, primarily in the first quarter of 2018.

Weighting the returns on the various types of financial asset with their respective time-varying portfolio share reveals the real total return accruing to households in Germany as a whole (see the above chart). This total return rose to an average size of 1.4% in 2017, having stood at 0.9% in 2016. In line with the path followed by returns on securities, however, it fell over the course of last year to stand at -0.8% at the beginning of 2018, thereby entering into negative territory for the first time in six years.

In particular, the total return was dampened by returns on bank deposits, whose contribution to the total return since the end of 2016 has entered further into nega-

tive territory than ever before in the reporting period. Returns on securities also reduced the total return significantly in the first quarter of 2018. The only positive contribution at the current end, as well as throughout the reporting period, stemmed from claims on insurance corporations; however, that contribution has been minor since 2017.

It is possible to calculate not just the role played by individual types of asset in connection with the real total return, but also the contribution of nominal returns, on the one hand, and the rate of inflation (as measured by the consumer price index, CPI), on the other (see the upper chart on page 34). Generally speaking, nominal returns had the largest, and a broadly positive, impact on the real total return over the entire reporting period. However, this contribution waned considerably in the course of 2017, primarily as a result of price losses in the capital market. Given that inflation at the same time remained relatively stable at positive levels of between 1.5% and 2%, the real total return *per se* was reduced by a significant margin. Lastly, in the first quarter of 2018, the negative contribution arising from the inflation rate exceeded the positive contribution generated by nominal returns, causing the real total return to fall below zero at the current end.

### Contributions to the real total return of households in Germany

Percentage points, annually/quarterly

Deutsche Bundesbank

### Structure of German households' financial assets

%, end-of-quarter data

<sup>1</sup> Besides other accounts receivable, this also comprises other equity.

Deutsche Bundesbank

For the most part, changes in portfolio composition only affected the evolution of the total return in a minor way (see also the lower chart on this page). Such changes may be triggered by active portfolio shifts or, particularly in the case of securities, by valuation effects. Their negligible importance is consistent with the observation that, despite the persistent low-interest-rate

environment, no major portfolio shifts were carried out by households.<sup>3</sup>

<sup>3</sup> With regard to possible portfolio shifts within the money-holding sectors in Germany, see Deutsche Bundesbank, Acquisition of financial assets and the search for yield in Germany, Monthly Report, May 2018, pp 30-33.

ment as well as for mergers, acquisitions and restructuring, while enterprises' recourse to their ample internal financing resources continued to curb demand. Furthermore, the latest results of the BLS indicate that banks eased their credit standards as well as credit terms and conditions for loans to enterprises in the second quarter of 2018, with the effect that demand is likely to have been further stimulated by banks' supply behaviour.

*Persistently high household demand for loans for house purchase; positive momentum in consumer credit persists*

The second key pillar of German banks' lending business remained loans to households. Crucial for the most recent spell of growth were once again loans for house purchase, which were similarly buoyant during the reporting period as in the previous quarters. On balance, the growth rate of loans for house purchase again increased slightly to 4.4% on the year. In line with the stable consumer sentiment, the positive development in consumer credit seen over the past few quarters consolidated, providing additional support to loans to households. Besides the sound income situation, the persistently high demand by households for bank loans in the reporting quarter was also spurred on by the still exceptionally favourable financing conditions. According to MFI interest rate statistics, interest rates for both housing loans and loans for private consumption remained close to their all-time lows despite slight increases.

This was consistent with the banks surveyed in the BLS reporting that the rise in demand for loans to households for house purchase in the quarter ended was once again attributable to the low general level of interest rates, favourable housing market prospects and robust consumer confidence. By contrast, respondents reported that stifling effects on household demand stemmed mainly from the heightened use of households' own savings in the context of property financing and the loss of market shares to competitors. In the case of consumer credit and other lending, the banks chalked up the rise in demand to the low general level of interest rates, to households' stable propensity

### Loans\* by German banks to the domestic private non-financial sector

\* Adjusted for loan sales and securitisation. **1** Non-financial corporations and quasi-corporations. **2** Including non-profit institutions serving households.

Deutsche Bundesbank

to purchase and to robust consumer confidence.

Moreover, banks' expansionary lending policies supported demand for loans to households. Thus, credit standards for loans to households for house purchase were eased slightly for the fourth consecutive time, and the surveyed banks intend to lower their credit standards even further in the third quarter. In addition, banks somewhat eased the credit terms and conditions specified in the loan agreements with their customers. Here, the vast majority of the adjustments again occurred in the area of margins, which were narrowed considerably

*Lending policies for private construction and consumer finance support demand overall*

## Banking conditions in Germany

**1** Including non-profit institutions serving households. **2** New business. According to the harmonised MFI interest rate statistics. Until May 2010, the aggregate interest rate was calculated as the average rate weighted by the reported volume of new business. As of June 2010, an interest rate weighted by the reported volume of new business is first calculated for each level. The aggregate interest rate is calculated by weighting the interest rates for the levels by the extrapolated volumes. **3** According to the Bank Lending Survey; for credit standards: difference between the number of respondents reporting "tightened considerably" and "tightened somewhat" and the number of respondents reporting "eased somewhat" and "eased considerably" as a percentage of the responses given; for margins: difference between the number of respondents reporting "widened considerably" and "widened somewhat" and the number of respondents reporting "narrowed somewhat" and "narrowed considerably" as a percentage of the responses given. **4** Expectations for 2018 Q3.

for average-risk loans, and markedly for riskier loans. Essentially, banks once again attributed the easing of standards and narrowing of margins to the high degree of competition.

The credit standards for consumer credit and other lending were eased marginally. Banks also eased their credit terms and conditions. On balance, the margins were thus narrowed markedly for average-risk loans and slightly for riskier exposures, while the other surveyed conditions remained virtually unchanged.

*Further strengthening of banks' capital position in the first half of the year*

As usual, the July survey of the BLS contained a number of *ad hoc* questions. Against the backdrop of the situation in the financial markets, German banks reported that their funding conditions had remained virtually unchanged compared with the previous quarter. As regards the effects of the new regulatory and supervisory activities, the surveyed banks stated that they had further strengthened their capital position in the first half of 2018. To answer the first-time question on the significance of various determinants for the level of credit margins in new business, the bank managers surveyed underlined – with regard to the first half of 2018 – the importance of intense competition, risk perception, cost of capital, compliance with the profitability targets of institutions and their operating costs. Competition, profitability targets and the cost of capital gained most in importance over the 2014 to 2017 period.

For the first time, the latest BLS contained a question on the impact of non-performing

loans (NPLs) on lending policies. According to the data provided by the surveyed German credit institutions, the NPL ratio (defined as the stock of gross NPLs on banks' balance sheets as a percentage of the gross carrying amount of loans) in the first half of 2018 had no impact on banks' credit standards or on credit terms and conditions, and banks do not expect any significant impact in the next six months either. By contrast, the banks reported that, when viewed in isolation, the NPL ratio in the reporting period from 2014 to 2017 had a slight tightening impact on credit standards for loans to enterprises and loans to households for house purchase, while it had only a marginal tightening impact on consumer credit and other lending. In addition, the NPL ratio *per se* marginally tightened credit terms and conditions for loans to enterprises. Compared with Germany, the NPL ratios of banks in the euro area led to a more pronounced tightening of lending policies. According to the participant banks, when viewed in isolation, the NPL ratio in the euro area overall had a slight tightening effect on credit standards and credit terms and conditions in the first half of 2018, and they expect similarly restrictive effects in the second half of the year as well. Furthermore, euro area banks reported that, for the period from 2014 to 2017, NPL ratios had a markedly restrictive effect on credit standards and a moderately tightening effect on credit terms and conditions.

*NPL ratio of German banks has no impact on their lending policies in the first half of 2018*

## ■ Financial markets

### ■ Financial market setting

*Financial markets influenced by heterogeneous growth rates and differing monetary policy stances*

In the second quarter and the early part of the third quarter, international financial markets reflected the overall robust global economic growth, the intensity of which varied, however, from one currency area to the next. Monetary policy decisions, along with expectations of the future economic policy stance, also showed evidence of these differences. For example, the US Federal Reserve continued its policy of gradually raising its benchmark interest rate. Furthermore, whereas at the end of March only one interest rate move had been expected for the second half of 2018, the sound outlook for the economy at the end of the reporting period meant that two interest rate moves over the rest of the year were seen as the most likely scenario. By contrast, at last report the euro area was not expected to see its first policy rate increase until the second half of 2019. This was due in large measure to the ECB Governing Council's communication of mid-June, which was perceived as being accommodative. Concern about how the trade conflicts between the major economic areas would unfold, uncertainty about the thrust of the new Italian government's policy, and the collapse of the Turkish lira prompted bouts of safe haven flows. (Implied) volatility in the various financial markets spiked at times, but hovered close to its long-term average overall. On balance, yields on ten-year Federal bonds (Bunds) dropped to 0.3%, whereas yields on ten-year US Treasuries rose to 2.9%. The yield spread between these two instruments stood at 260 basis points for a time, the widest it has been since the end of the 1980s. The GDP-weighted yield for the euro area excluding Germany climbed to 1.4%, largely on the back of an increase in yields on Italian government bonds. Yields on euro area corporate bonds also edged higher. Equity markets largely mirrored the upbeat path of the economy, though in the euro area the aforementioned political uncer-

tainties did put a damper on price momentum. On a weighted average against the currencies of 19 major trading partners, the euro slipped slightly on balance.

### ■ Exchange rates

In foreign exchange markets, the euro's exchange rate put in a mixed performance between the end of March and mid-August, with the euro depreciating markedly against the US dollar. Owing to diverging economic prospects on each side of the Atlantic, the euro was already beginning to lose value against the US dollar in mid-April 2018. This fall in the value of the euro was given additional momentum in May in connection with the uncertainty over whether it would be possible to form a government in Italy. At the same time, the vote of no confidence against the then Spanish Prime Minister weighed on the euro. The euro had a value at the end of May of US\$1.16, its lowest level since July 2017.

*Euro down against the US dollar, ...*

Only when an Italian government began to emerge did the euro begin to recoup some of the losses it had incurred against the US dollar. Further tailwinds came from surprisingly high inflation figures for Germany and Italy, which appear to have been interpreted by market players as signalling a possible reduction in the Eurosystem's extraordinary monetary policy stimulus. The euro was given additional lift by statements from the ECB Governing Council hinting that there would be a discussion on the continuation of the asset purchase programme at its monetary policy meeting at the beginning of June. However, these gains began to erode again following the meeting. While the ECB Governing Council announced a timetable for ending the net asset purchases, policy rates are set to remain at their present levels at least through the summer of 2019. This decision

came as a surprise to many market participants and weighed on the euro.

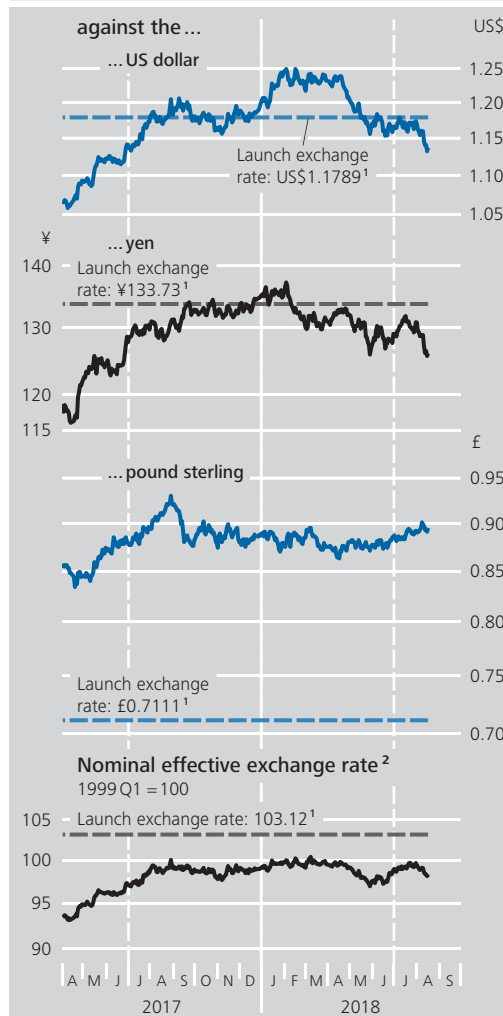

Thereafter, the euro-dollar rate hovered between US\$1.15 and US\$1.18. On this side of the Atlantic, agreement on the disbursement of further financial assistance to Greece and some surprisingly upbeat sentiment indicators buoyed the single currency. For example, the Purchasing Managers' Index for the euro area and the Ifo business climate index for the German economy were unexpectedly favourable. This was counterbalanced, however, by some likewise surprisingly positive US economic data. Furthermore, the Chair of the Federal Reserve, Jerome Powell, firmed expectations of further interest rate hikes in 2018 in his speech before the US Senate. At the end of the reporting period, the euro was trading slightly lower again at US\$1.14, down by around 7.7% on its level at the end of March.

... and the yen, ...

After a period of only minor fluctuations, the euro came under marked pressure against the yen in May. Headwinds included the aforementioned publication of surprisingly weak economic data for the euro area, as well as the bouts of political uncertainty in Italy and Spain. At the end of May, the euro stood at approximately ¥126, its lowest level since June 2017. As the political prospects in these European countries brightened and inflation figures for the euro area came in higher than expected, this price movement reversed. In addition, a handful of unexpectedly weak economic numbers were reported for Japan. Both gross domestic product (GDP) growth in the first quarter of the year and the rise in consumer prices in June fell short of market participants' expectations. At the end of July, the monetary policy decisions taken by the Bank of Japan surprised some market participants, who had evidently been expecting a less expansionary stance. However, this only strengthened the euro against the yen for a short time. This was partly because the initial estimate of Japanese economic growth in the second quarter was higher than the majority of market participants had

### Exchange rate of the euro

Daily data, log scale

 Deutsche Bundesbank

expected. As this report went to press, the euro stood at ¥126, down 3.9% on its level at the end of March.

From the beginning of May until the end of June, the euro's exchange rate hovered at a level between £0.87 and £0.88 without any lasting price changes for this currency pair. However, at the end of June, statements from the Bank of England calling into question the need for higher interest rates in the United Kingdom placed the pound sterling under pressure. While the continued uncertainty surrounding the negotiations over the United Kingdom's withdrawal from the European

Deutsche Bundesbank

Union did not initially seem to have any lasting influence on the EUR-GBP exchange rate, the euro continued to appreciate when economic data from the United Kingdom in mid-July disappointed market observers and a no-deal Brexit came to be seen as a more likely scenario. As this report went to press, the euro stood at £0.89, up 2.3% on its level at the end of March.

*Euro depreciates slightly in effective terms*

Overall, the euro depreciated slightly on a weighted average against the currencies of 19 major trading partners (down 1.2% on balance), even if it did appreciate against individual currencies such as the renminbi (+1.2%). Factors weighing on the Chinese currency included the trade dispute with the United States. Outside the group of 19 partner currencies, the euro recorded considerable gains against the Turkish lira (+35.5%). Various monetary policy measures were taken, but none succeeded in braking the lira's depreciation for more than a temporary period. Market participants won-

dered at times how much room for manoeuvre the Turkish central bank actually has. Since the beginning of August, the lira has been plumb-ing ever greater depths against the euro, after the United States imposed sanctions on two Turkish ministers and a trade conflict erupted between these two countries.

## Securities markets and portfolio transactions

Government bond yields in the various cur-rency areas saw mixed developments from the end of March. They initially rose worldwide via the interest rate linkage with the United States until mid-May. This was primarily a result of the temporary increase, most notably in the United States, in term premiums – that is, the pre-miums that remunerate investors who are will-ing to hold securities with longer residual ma-turities. One reason for this, besides the com-paratively robust pace of economic growth, was US government debt, which the Con-gressional Budget Office estimates will grow sig-nificantly in the future in the wake of the tax reform.

*Government bond yields rose initially around the world*

In mid-May, financial market participants' con-cerns about how the political situation in Italy would unfold led to safe haven flows, though these then reversed again rather quickly. Within the space of a week, yields on benchmark paper fell significantly in the major currency areas, above all in the euro area. They rose again thereafter, but without returning to their initial levels. Towards the end of the reporting period, the sharp depreciation of the Turkish lira and related concerns about the solvency of Turkish debtors who have taken out loans denominated in foreign currency prompted a further flight into safe assets.

*Politically induced safe haven flows seen for a time*

Recent months have seen US trade policy, which market observers have considered in-creasingly confrontational and erratic, repeat-edly have an influence on yield movements. At the end of July, the joint statement by the

*Trade disputes influence yields, depending on news reports*

US President and the President of the European Commission on sounding out the scope for a trade agreement temporarily led to a certain easing. However, almost at the same time, there were growing signs that the trade dispute between the United States and China could intensify. Overall, though, uncertainty in bond markets, as measured by the implied volatility of options, remained within fairly narrow bounds. One reason for this could be that this ratio has a relatively short expectation horizon of three months, which makes it less suited to modelling potential long-term negative consequences for the world trade framework.

*On balance, yield on ten-year US Treasuries up and ...*

On balance, the yields on ten-year US Treasuries climbed 13 basis points over the period under review to 2.9%. Looking at the entire period under review, the main reason for this was – as mentioned at the outset – that, overall, monetary policy interest rate expectations increased against the backdrop of the favourable economic data for the United States.

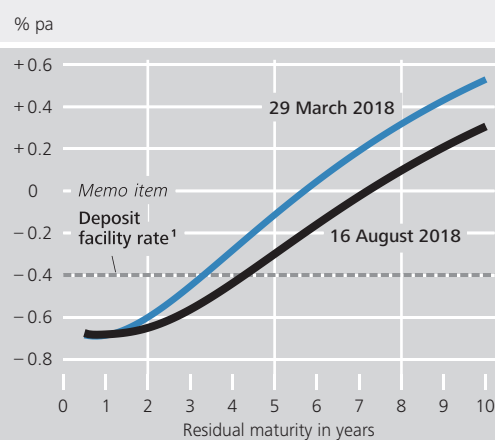

*... yield on ten-year Bunds down*

By contrast, the yield on ten-year Bunds has fallen to 0.3% since the end of March. In addition to the dwindling term premium, the expected monetary policy also contributed to this. Against this backdrop, the spread between the United States and Germany widened to 257 basis points at last count.

*Downward shift in yield curve*

From the end of March, the yield curve derived from the yields on Federal securities twisted downwards at the long end, while short-term interest rates remained virtually constant. Interest rates up to a maturity of seven years were in negative territory at last count. The announcement by the ECB Governing Council in June to prospectively reduce the monthly pace of the net asset purchases under the expanded asset purchase programme (APP) to €15 billion as of October and to discontinue them at the end of the year was largely in line with market expectations. One surprise for market participants, however, was the news that the ECB Governing Council decided at the same meeting to keep the deposit facility rate at its cur-

 Deutsche Bundesbank

rent level at least through the summer of 2019. This caused the yield curve to shift somewhat downwards. At the end of the reporting period, the yield curve, as measured by the spread between ten-year and two-year yields, was 17 basis points flatter than at the end of March.

The yield spread between ten-year Bunds and ten-year government bonds of other euro area countries (GDP-weighted average) widened by 48 basis points. The main reason for this was the uncertainty surrounding the monetary and fiscal policy stance that the new Italian government would take; starting in mid-May this led

*Widening of yield spreads in the euro area*

Sources: Bloomberg and Bundesbank calculations.  
 Deutsche Bundesbank

to a widening of yield spreads, particularly of Italian paper over Bunds. At last count, the yield spread of Italian bonds was still well above its end-of-March level, measuring 282 basis points. Creditors of the Italian government are evidently following the domestic debate closely and are demanding compensation for possible longer-term political risks. The yield spreads of government bonds from other euro area countries over German Bunds also widened during the period under review. On the whole, the yields of countries with lower credit ratings rose more sharply. One exception to this were Greek sovereign bonds, whose yields changed little on balance following the finalisation of deliberations on the forthcoming end of the third Economic Adjustment Programme for Greece and a subsequent upgrading by the rating agencies Standard & Poor's and Fitch. Overall, the yield spread between bonds increased more sharply than the corresponding costs for credit default swap contracts – which are, in effect, insurance which market participants can

take out to hedge their exposure to default risk. The wider spread is presumably an indication of higher liquidity premiums for Federal securities. The fact that the spread of bonds issued by the KfW banking group (Kreditanstalt für Wiederaufbau) over Bunds has also widened would certainly suggest that this is the case.<sup>1</sup>

At 1.2%, yields on ten-year UK gilts were somewhat down on the end of March at last count. The Bank of England's decision at the start of August to raise its policy rate had no discernible impact on long-term yields. The dispute within the UK government over how the country should withdraw from the EU likewise did not trigger any movements of note in the bond markets. The yield on ten-year Japanese government bonds, meanwhile, climbed to 10 basis points, leaving it 5 basis points higher than at the end of March. The end of July saw the Bank of Japan decide to alter its yield curve control policy and widen the yield corridor for ten-year bonds. This move came after multiple BoJ interventions in the bond market at the ceiling previously in place.

*Yields in the United Kingdom and Japan see little change*

During the period under review, the five-year forward inflation rates five years ahead derived from inflation swaps fluctuated within a narrow corridor around the 1.7% mark (+2 basis points). The long-term survey-based inflation expectations collected by Consensus Economics are still higher than that, at 2.0%. When interpreting this difference, it is necessary to consider potential scarcity, liquidity and inflation risk premiums which can have a bearing on market-based measures and dilute their informative value as economic indicators. Both market-based and survey-based deflation probabilities are negligible for the coming years.

*Forward and survey-based inflation expectations steady*

<sup>1</sup> Bonds issued by the Kreditanstalt für Wiederaufbau (KfW) are explicitly guaranteed by the Federal Republic of Germany. Their default risk is therefore the same as that of German Federal securities, and the yield spread contains premiums for the higher market liquidity of Federal securities. See Deutsche Bundesbank, The market for Federal securities: holder structure and the main drivers of yield movements, Monthly Report, July 2018, pp 15-38.

*Yields on corporate bonds up from low level*

Yields on European corporate bonds have been picking up slightly since the end of the first quarter from what is still a low level. Bonds issued by BBB-rated enterprises with a residual maturity of between seven and ten years yielded 22 basis points higher at 2.0%. The drop in yields on German Federal securities in the seven to ten-year residual maturity bracket in the same period meant that the yield spread widened still further. One contributing factor here is the somewhat higher level of attention overall which investors have been paying to riskier paper since mid-May. The yield spread of financial corporate bonds over Bunds rose somewhat more sharply than that of non-financial corporate bonds. This might have something to do with the fact that financial corporations were feeling the effects of the yield on safe bonds in the euro area having returned to a somewhat lower level. What is more, the price losses registered above all by Italian sovereign bonds from mid-May onwards spilled over to affect yields for financial corporations. This is normally the case because there are sometimes close financial ties between the state as an issuer and banks as investors. Towards the end of the reporting period, some financial corporations were weighed down by their exposures in Turkey. Meanwhile, more creditworthy corporations rated AA have even seen their yields dwindle slightly since the end of March, while the spreads on high-yield bonds experienced stronger-than-average increases. Compared with their five-year means, however, financing conditions for enterprises are still favourable.

*Net redemptions in the German bond market*

Gross issuance in the German bond market amounted to €326 billion in the second quarter of 2018, well up on its previous-quarter level (€298½ billion). After deducting redemptions and taking account of changes in issuers' holdings of their own bonds, net redemptions of bonds came to €5 billion. Foreign borrowers placed debt securities worth €3 billion net in the German market, meanwhile. The outstanding volume of debt securities in the German

bond market thus fell by €2 billion net in the period under review.

In the second quarter, the public sector again redeemed bonds, this time amounting to €8 billion net, following €8½ billion in the previous quarter. These figures also include issues by resolution agencies set up for German banks, which are ascribed to the public sector for statistical purposes. The Federal government itself redeemed mainly five-year Federal notes (Bobls), amounting to €23½ billion. This contrasted with net issuance of ten-year and 30-year Bunds totalling €8½ billion and €6 billion, respectively, as well as Treasury discount paper (Bubills) worth €5 billion. The quarter under review saw state and local governments redeem their own bonds to the tune of €1½ billion net.

Across April, May and June, domestic credit institutions reduced their capital market debt by €4½ billion net, following net issuance of €25

*Decline in public sector capital market debt*

*Net redemptions by credit institutions*

billion in the previous quarter. The decline mainly concerned the outstanding volume of other bank debt securities that can be structured flexibly (€7½ billion) and of public Pfandbriefe (€3½ billion). By contrast, there was net issuance of mortgage Pfandbriefe and debt securities issued by specialised credit institutions, amounting to €3½ billion and €3 billion, respectively.

*Increase in enterprises' capital market debt*

Domestic enterprises issued debt securities worth €7½ billion net in the second quarter, the bulk of which, on balance, were bonds with maturities of more than one year. Net issuance by non-financial corporations and by insurers (€1 billion and €½ billion, respectively) was lower than issuance by other financial intermediaries (€5 billion).

*Purchases of debt securities*

The Bundesbank was the main buyer of debt securities in the German bond market in the second quarter, acquiring €19 billion worth of paper, predominantly under the Eurosystem's asset purchase programmes. These were primarily domestic securities issued by the public sector (€16 billion). Domestic non-banks purchased debt securities to the tune of €9½ billion. By contrast, foreign investors and domestic credit institutions offloaded bonds amounting to €19½ billion and €11 billion net, respectively.

## ■ Equity market

*Global stock markets influenced by overall robust economic backdrop*

The overall robust macroeconomic environment and an altogether upbeat corporate profit outlook shaped international equity markets from the end of March. However, price growth was dampened in the euro area especially by the political risks stemming from Italy and Turkey. At +0.6% and -0.5%, respectively, the broad EUROSTOXX index and the German CDAX were virtually unchanged from their end-of-March levels. Taken in isolation, the easing risk-free interest rates buoyed up price developments in the euro area. Falling risk-free interest rates depress the discount factor, raising the

value of future profits. In addition, profit expectations rose again from their already elevated level. It is possible that the euro's quite considerable depreciation against the US dollar also played a role here since it is serving to boost the sales opportunities of euro area enterprises in the medium term. However, against the backdrop of the political uncertainty referred to above, market participants demanded a higher risk premium. The US S&P 500 racked up notable gains, climbing by 7.6%. With the US economy running smoothly, the quarterly reporting season is shaping up predominantly well there, and market analysts revised their medium-term profit expectations upwards. The indices in Japan (Nikkei 225) and the United Kingdom (FTSE-All Share) rose by 3.4% and 6.6%, respectively.

While the political uncertainties described above had a direct impact on both share prices and measures of volatility, the effects were, for the most part, short-lived. They do, however, remain a source of bother and could well cloud the favourable market environment – especially in those branches which are particularly affected and stand at the centre of the trade dispute. European automotive stocks have recorded significant losses since the end of March, for instance.

*European automotive and bank shares underperform total market*

The same is true for bank shares which – on both sides of the Atlantic – underperformed the total index for the respective region. While US bank stocks posted flatter gains of 4.5%, shares in euro area banks fell significantly in value even in absolute terms, losing 15.7%. The latter managed to recoup only a small portion of the fall in prices triggered at the end of May by the uncertainty in Italy. Some banks also saw their share prices take a hit from their exposure to Turkey. The yield curve, now flatter again than it was at the end of March, was another factor weighing on banks' earnings prospects in the euro area.

The EUROSTOXX earnings yield, calculated on the basis of earnings forecasts for the next 12

*Implied cost of equity unchanged in the euro area, falling in the USA*

months (the inverse price/earnings ratio) fell against the end of March, indicating a higher valuation than at the end of the first quarter. By contrast, the implied cost of equity – which is derived using a dividend discount model from the sum of the risk-free interest rate and the equity risk premium – remains virtually unchanged.<sup>2</sup> The equity risk premium compensates investors for holding risky equities instead of safe Federal securities. Taken in isolation, the risk premium remained well above its multi-year average. This is a reflection of the fact that the risk-free interest rate and the risk premium normally move in opposite directions, offsetting each other's effect on the cost of equity. In the United States, share prices rose so sharply that despite improved business outlooks, the earnings yield and implied cost of equity fell. The risk premium relative to US Treasuries shrank during the period under review.

*Stock market funding and stock purchases*

Issuance in the German equity market was somewhat brisker in the second quarter than it had been in the three months before that. Domestic enterprises issued €11 billion worth of new shares. This was largely attributable to a capital increase carried out by one DAX-listed enterprise. The outstanding volume of foreign shares in the German market rose by €15½ billion over the same period. Equities were purchased primarily by domestic non-banks (€22 billion) and foreign investors (€3½ billion), but also – to a lesser extent – by domestic credit institutions (€1 billion).

*Sales and purchases of mutual fund shares*

During the quarter under review, domestic investment companies recorded inflows of €17 billion, after raising funds totalling €32½ billion in the previous three-month period. The fresh money mainly accrued to specialised funds reserved for institutional investors (€13 billion). Among the various asset classes, mixed securities-based funds attracted the strongest inflows (€9½ billion), but bond funds (€3 bil-

Deutsche Bundesbank

lion) also sold new shares, as did funds of funds and open-end real estate funds (€2½ billion in each case). Foreign funds operating in the German market attracted fresh funds totalling €4½ billion net in the second quarter of 2018. Domestic non-banks were the main buyers, adding mutual fund shares worth €23 billion to their portfolios, predominantly in the form of domestic fund units. German credit institutions purchased investment fund shares for €1½ billion, while foreign investors sold mutual fund shares worth €3 billion.

## Direct investment

As with cross-border portfolio investment, which saw net outflows totalling €25 billion in the second quarter of 2018, there were also net capital exports in the field of direct investment, amounting to €30½ billion.

*Direct investment sees capital exports*

Direct investment abroad by German enterprises came to €55 billion net in the April-June 2018 period. Domestic investors boosted their equity capital by €58 billion, with a clear emphasis on investment in equity capital in the narrower sense; foreign earnings were also reinvested as well, however. By contrast, German enterprises scaled back intra-group lending by €2½ billion in the period under review. Major euro area destinations for German foreign direct investment in the second quarter of 2018 were the Netherlands (€30 billion), Spain (€16 billion) and Ireland (€5 billion), while outside of the euro area the United States was a key recipient (€2½ billion).

*German foreign direct investment*

Foreign investors stepped up their direct investment in Germany by €24½ billion on balance in the second quarter, primarily in the shape of loans to affiliated enterprises in Germany, supplied particularly by way of "reverse flows" – vehicles which foreign subsidiaries use to forward funds raised in the international financial market to their parent companies as loans. By contrast, intra-group trade credits were mainly redeemed. Foreign investors increased their

*Foreign direct investment in Germany*

equity stakes in domestic enterprises only slightly (€1 billion), mainly using reinvested earnings to do so. In regional terms, investors from the euro area, particularly from the Netherlands (€20½ billion) and Belgium (€5 billion), played a major role.

## Economic conditions in Germany

### Macroeconomic situation

*German economy back to stronger growth in second quarter*

After the year got off to a moderate start, aggregate economic activity rebounded quite strongly in spring 2018. According to the flash estimate by the Federal Statistical Office, the growth rate of real gross domestic product (GDP), after adjustment for seasonal and calendar effects, rose slightly on the first quarter of 2018 to 0.5%.<sup>1</sup> Diminishing one-off effects such as the extremely virulent wave of influenza, which had dampened economic activity in the winter months, are likely to have had merely a limited impact. This meant that the economic boom in Germany was still ongoing. However, the pace of growth in the first half of 2018 failed to match the high rates of the previous year, and the current underlying cyclical trend is probably only marginally above the potential rate. The already high degree of

aggregate capacity utilisation is therefore only edging up. Private consumption – currently the linchpin of economic expansion – continued its ascent in the second quarter. Government consumption probably likewise rose significantly following a distinct decline in the previous quarter, the first in many years. Moreover, following a drop at the beginning of the year, exports grew moderately. The same is probably the case for business investment in machinery and equipment.

In the second quarter of 2018, industrial activity remained largely listless. Although the manufacturing industry may well have contributed slightly to aggregate growth, it was unable to re-assume the role as the key economic driving force that it had in the previous year. For business-related services, the upturn continued. In spite of capacity constraints, construction output increased once again.

*Industry lacking momentum; services and construction, by contrast, dynamic*

#### Overall output

2010 = 100, price and seasonally adjusted

Source of unadjusted figures: Federal Statistical Office. <sup>1</sup> Only calendar-adjusted.  
 Deutsche Bundesbank

In real terms, German firms' export business expanded again in the second quarter of 2018, after declining significantly in the winter months. According to the seasonally adjusted figures available up to May, the recovery was due primarily to a countermovement in exports of goods to non-euro area countries, which had previously declined. Exports to the newly industrialised economies in Asia, the south and east Asian emerging markets and the United Kingdom rose particularly strongly. German exporters were also able to considerably boost their export sales to central and east European countries. In terms of value, exports to the United States remained at the level of the pre-

*Exports back in positive territory*

<sup>1</sup> GDP growth in the first quarter of 2018 was revised upwards by 0.1 percentage point to 0.4%. Following the usual mid-year revision of previous years' data, GDP growth at the beginning of 2017 was even stronger. By contrast, the pace of expansion throughout the rest of the year was somewhat more moderate. Furthermore, GDP growth was revised upwards by 0.3 percentage point in 2014 and 2016. On the whole, the upswing is therefore stronger and probably also more mature than previously reported.

vious quarter. By contrast, business with China declined again slightly. Exports to Japan, Russia and the OPEC countries even fell considerably in the quarter under review.

*Enterprises' investment activity probably showing little momentum*

Business investment in new machinery and equipment is likely to have increased only moderately in the second quarter. This was probably because of an overall decline in demand impulses for industry in the first half of the year and because corporate sentiment was also no longer as euphoric as before. Capital goods imports rose strongly in the second quarter. Even excluding the very considerable rise in imports of other transport equipment, the increase was still strong. However, domestic sales of capital goods manufacturers declined considerably. Car manufacturers, in particular, suffered a sharp decline in domestic sales. Furthermore, the drop in the number of commercial motor vehicle registrations suggests that enterprises did not further expand their vehicle fleets in the reporting period.

*Construction investment still pointing upwards*

Construction investment probably expanded further in the second quarter of 2018. The turnover figures for the main construction sector available up to May indicate that more was invested in commercial and public buildings in particular. Following the strong growth in the previous quarter, private housing investment probably rose much more moderately.

*Marked rise in private consumption*

Household consumption expenditure again made a distinct contribution to overall economic growth in the second quarter of 2018. This can be seen above all in the significant increase in retail sales. Sales growth was strongest in online and mail order trade. Retail sales of information and communication technology (ICT) equipment also flourished, and sales of do-it-yourself (DIY) and home improvement goods likewise grew quite substantially. By contrast, sales of electrical household appliances, furniture and furnishings were down significantly on the previous quarter. The hotel and restaurant sector was again able to perceptibly increase its turnover, which was probably due

in part to the comparatively warm and sunny weather in the spring. By contrast, households were clearly holding back on purchasing new motor vehicles following the extremely buoyant activity in the automotive sector in the previous quarters.

Imports in the second quarter of 2018 rose considerably on the level of the previous quarter in price-adjusted terms. This was attributable to the increase in domestic demand and the marked rise in exports. That said, some of the imports were probably used to restock warehouses. The increased uncertainty about greater restrictions on international trade in

*Steep rise in imports*

### Output in industry and in construction

2015 = 100, seasonally adjusted, quarterly, log scale

 Deutsche Bundesbank

future may have played a role in this. In regional terms, imports from the euro area – according to the seasonally adjusted value-based figures available up to May – increased only slightly. Imports from non-euro area countries rose strongly, however, and also on a broad basis. This was due mainly to very substantial growth in imports from the United Kingdom. However, this was attributable to orders from the aircraft and aerospace industry and is therefore likely to represent a one-off special effect. Manufacturers from the newly industrialised Asian countries and the United States also benefited strongly from buoyant domestic demand. The strong increase in the value of imports from the OPEC countries was probably the result of the considerable rise in crude oil prices in the reporting period.

## ■ Sectoral trends

Industrial output went up again slightly in the second quarter of 2018 by a seasonally adjusted ¼%, after virtually stagnating at the beginning of the year. The development across the economic sectors was very heterogeneous, and the muted growth in output was driven by just a few industrial sectors. The production of pharmaceutical products rose particularly sharply, which meant that the consumer goods sector recorded the strongest overall growth in output among the main groups. By contrast, the output of capital goods was only slightly up on the level of the previous quarter. Here, too, the increase was attributable to just one important industrial segment, the automotive sector. German mechanical engineering firms, meanwhile, were forced to cut production sharply. The output of intermediate goods did not exceed the average of the first three months of the year.

*Slight increase in industrial activity*

According to Ifo Institute data, the level of capacity utilisation of tangible fixed assets in manufacturing remained at the high level of the previous quarter. This is likely to be related to the fact that business investment in machinery and equipment rose only slightly. The modest growth in industrial output was probably accompanied by correspondingly weak capacity expansion. Capacity utilisation changed only slightly across the individual sectors of industry.

*No change in industrial capacity utilisation*

Construction activity rose steeply in the second quarter of 2018 after adjustment for seasonal variations. The main reason for the growth in construction output by 1½% was a substantial increase in production in the main construction sector, where exceptionally strong growth was recorded in both general building and civil engineering. Activity in the finishing trades, by contrast, contracted considerably. There is still much evidence to suggest that the construction sector is working at full capacity. According to the Ifo Institute, for example, equipment utilisation in the main construction sector remained very high, and the share of construc-

*Strong growth in construction output*

tion firms reporting production hold-ups owing to the shortage of skilled workers reached a new record high in the second quarter. There was a sharp rise in construction prices. The fact that seasonally adjusted construction output still increased considerably compared to the winter months could be attributable in part to the wave of influenza and the unfavourable weather conditions in February and March. This is suggested, in any case, by the circumstance that the number of hours worked in the main construction sector rose considerably slower than employment at the beginning of the year, whereas the opposite was observed in April and May. Enterprises also sought to expand their potential output, with the number of employees in the main construction sector rising distinctly after the turn of the year.

growth was no longer as buoyant. Employment growth continued to be driven by jobs subject to social security contributions. Exclusively low-paid part-time employment, as before, fell slightly, while self-employment dropped more significantly. In the quarter under review, unemployment likewise did not fall as sharply as in the winter, yet given the low level achieved, this fall was still quite considerable. Over the same period, the number of job vacancies went up only a little from the exceptionally high level achieved in the spring. Other, survey-based leading indicators of labour market developments either fell slightly or remained virtually unchanged in the last few months. On the whole, the outlook for the labour market remains good.

*Services sector still showing marked growth*

All in all, the services sectors are likely to have expanded perceptibly again in the second quarter of 2018. Price-adjusted wholesale sales increased significantly. Enterprises in the retail trade sector (excluding motor vehicle trade) likewise managed to increase their sales in real terms. Furthermore, growing activity in the hotel and restaurant sector provided a boost. Positive impetus probably also came from motor vehicle trade, where total sales rose significantly despite a clear decline in motor vehicle registrations. This was due in particular to strong growth in the sales of motor vehicle parts and accessories as well as motorcycles. Business activity in the other services sectors is also likely to have expanded. This is suggested by the fact that the business situation in this sector is viewed very optimistically despite a slight downward revision.

Employment in Germany rose more slowly in the second quarter of 2018 than it had done beforehand. It went up by a seasonally adjusted 86,000 persons, or 0.2%, after a revised +0.5% in the first quarter. The slowdown in the pace of expansion is likely to be due to the extensive hiring of new workers immediately beforehand and the weaker underlying pace of growth since the beginning of the year. In addition, the fact that it is becoming increasingly difficult to find suitable skilled labour may have had a negative impact on employment growth. The vacancy periods for open positions, for instance, have been rising significantly across all sectors for quite some time.

*Slowdown in employment growth*

## ■ Labour market

*Labour market situation very good, but improvement not as strong as in previous quarters*

In the second quarter, the labour market in Germany was again in very good shape, characterised by high employment and low unemployment. However, the situation did not improve as strongly as in previous quarters: although employment rose markedly, this

The considerable increase in jobs subject to social security contributions continued to drive the rise in employment. According to initial estimates by the Federal Employment Agency (BA), on an average of April and May, the number of positions filled rose by just under 0.4% compared with the average for the first quarter. Services such as IT and logistics recorded the highest growth rates. Employment in the manufacturing sector also experienced above-average growth, as did business-related services if temporary agency work is excluded, where the number of jobs fell relatively sharply. One possible explanation for this is that the reform

*Growth in jobs subject to social security contributions broadly based across sectors, but strong decline in temporary agency work*

## Labour market

Seasonally adjusted, quarterly

Sources of unadjusted figures: Federal Statistical Office and Federal Employment Agency. **1** Not seasonally adjusted. **2** Excluding seasonal jobs and jobs located abroad.

Deutsche Bundesbank

of the Act on Labour Leasing (*Arbeitnehmerüberlassungsgesetz*) of 1 April 2017 introduced a maximum period of labour leasing of 18 months. This could now be having an effect as the first people would shortly have to be given permanent positions. Employment in the health and social services sector enjoyed predictably robust growth. In construction, in the wholesale and retail trade, and the hotel and restaurant sector, the number of positions filled was up only slightly in the first months of the second quarter.

Registered unemployment fell distinctly in the second quarter after seasonal adjustment, although taking the average of the reporting period, the decline of 39,000 persons was not as steep as in the preceding quarter. The unemployment rate fell by 0.2 percentage point to 5.2%. However, this was partly attributable to the adjustment, which takes place every spring, to the labour force measure used by the Federal Employment Agency to calculate the unemployment rate. The number of registered unemployed continued to decrease slightly in July. While unemployment covered by the statutory insurance scheme has been very low for some time and did not fall appreciably, the number of unemployed persons receiving the basic welfare allowance went down. This is mainly due to a significantly smaller risk of receiving the basic welfare allowance, as the current high demand for labour means that fewer persons are long-term unemployed or in need. By contrast, the rate of people no longer needing the basic allowance was up only slightly. The Federal Employment Agency's more broadly defined measure of underemployment, which also counts those participating in active labour market policy measures, fell even more strongly than registered unemployment. Significantly fewer people are currently receiving support through short-term labour market reintegration measures, further professional training or one-euro jobs than a year ago.

*Number of unemployed persons down, particularly those receiving basic welfare allowance*

*Leading indicators remain high*

According to the leading labour market indicators, employment is likely to expand over the next few months at much the same rate as during the period under review. The most important leading indicators, including the Ifo employment barometer, the employment component of the IAB labour market barometer and the Federal Employment Agency's BA-X job index, remained virtually unchanged over the last few months and are still at an exceptionally expansive level. Nonetheless, the number of vacancies continued to rise, albeit somewhat more slowly. The leading indicator for unemployment in the IAB labour market barometer was down again slightly and is only just in positive territory. This suggests that registered unemployment will probably not decline appreciably in the next few months.

## ■ Wages and prices

*Negotiated wages up more sharply in spring than before*

Negotiated wages rose sharply in the spring quarter, reflecting the fact that recent wage settlements were higher than in the last pay round given a healthy economy and a tight labour market. The rise in negotiated rates of pay including all additional benefits in spring 2018, at 3.2% on the year, was significantly higher than just three months before (2.2%). Already in the first quarter of 2018, actual earnings had picked up somewhat more strongly than in earlier periods. This trend could well have continued in the second quarter.

*Substantial two-stage increase in general statutory minimum wage*

At the end of June, the independent Minimum Wage Commission unanimously decided to recommend to the Federal Government a rise in the general minimum wage by a total of 51 cents, or 5.8%, over the next two years.<sup>2</sup> The minimum wage will therefore rise in an initial stage as of January 2019 from the current €8.84 to €9.19 per hour and in a second stage as of January 2020 to €9.35 per hour. The Federal Government announced that it would implement this proposal. The last rise in the minimum wage in January 2017 was lower, at 4% in total. The general statutory minimum wage

### Rates of pay and wage drift

Year-on-year percentage change, on monthly basis

Sources: Federal Statistical Office (actual earnings) and Deutsche Bundesbank (negotiated rates of pay).  
 Deutsche Bundesbank

tracks past negotiated wage developments with a lag and is intended to have the smallest possible impact on future wage rounds. The suggested rise in the minimum wage will probably have a significant impact on wage negotiations only in individual low-wage sectors.

Consumer prices (as measured by the Harmonised Index of Consumer Prices, or HICP) continued to rise sharply in the second quarter. Roughly half of the seasonally adjusted 0.6% increase was attributable to energy prices, reflecting the distinct rise in crude oil prices denominated in US dollars, an effect which

*Sharp rise in consumer prices in spring*

<sup>2</sup> The Minimum Wage Commission's resolutions base the size of the statutory minimum wage on past developments in negotiated hourly earnings, excluding special payments, according to the negotiated wage index of the Federal Statistical Office. The latest decision to raise the minimum wage was based on the trend in negotiated wages for 2016 and 2017 and the first half of 2018. The rise in negotiated wages in the first half of 2016, which was already factored into the increase in the minimum wage at the beginning of 2017, has thus obviously been taken into account twice when raising the minimum wage.

### Import, export, producer and consumer prices

2010 = 100, seasonally adjusted, quarterly

Source of unadjusted figures: Federal Statistical Office. **1** Producer price index for industrial products in domestic sales. **2** Harmonised Index of Consumer Prices. **3** Not seasonally adjusted.

Deutsche Bundesbank

was amplified by the depreciation of the euro. Food products likewise became markedly more expensive, which was due in part to higher prices for tobacco products, which the HICP counts under food. Excluding energy and food, prices rose similarly moderately to the previous quarter. Prices in several sub-sectors of the services sector went up, including rents. Prices for industrial goods excluding energy were barely up on the quarter, but began to accelerate over the course of the second quarter. One of the reasons for this may be that import prices for the relevant goods rose markedly owing to the euro's depreciation. At the commercial producer level, too, prices continued their gradual

climb. The headline annual HICP inflation rate rose clearly from 1.3% to 1.9%.<sup>3</sup> It passed the +2% mark in May and in June owing to the sharp rise in energy prices. Excluding energy and food, annual inflation in the spring was more or less constant at 1.2% and, consistent with aggregate capacity overutilisation, remained above its longer-term average.

In July, consumer prices remained unchanged in seasonally adjusted terms. Consumers had to pay just as much for energy and food as in the previous month. Prices for industrial goods excluding energy went down distinctly overall due to exceptionally strong discounts for clothing, although prices for other industrial goods excluding energy rose moderately. Prices for services including rents also rose somewhat. Annual headline HICP inflation was unchanged at 2.1%,<sup>4</sup> and it was also more or less constant at 1.2% when excluding energy and food.

*Inflation still above 2% in July ...*

Headline inflation is likely to stabilise at around 2% over the next few months. Energy and food price inflation is likely to slow somewhat. However, the rate excluding energy and food should edge up as prices for clothing are likely to be raised as new collections are introduced. Furthermore, the reductions in motor vehicle insurance premiums in October 2017 drop out of the annual inflation rate calculation in the autumn.

*... and is not expected to change substantially over the next few months*

## Orders received and outlook

The German economy will probably remain on a sound growth path in the summer of 2018. The pace of growth could end up being somewhat slower than the average for the first half of the year, however. Industry, for instance, is not expected to make any meaningful contribution to aggregate growth. Although the stock of orders still being processed remains

*German economy stays on expansionary course*

<sup>3</sup> The headline CPI figure was +2.0% compared with +1.5%.

<sup>4</sup> The CPI figure was +2.0% from likewise +2.1%.

exceptionally high and short-term output expectations in the manufacturing sector have stabilised at an elevated level, new orders received by industry were down again in the quarter under review. To exacerbate matters, problems encountered during the transition to a new emission test cycle are likely to markedly constrain motor vehicle production in the summer months. By contrast, private consumption is likely to benefit from the excellent labour market situation and the current strong wage growth, thus maintaining its role as a key driver of German economic growth.

*Scarcely any further deterioration in sentiment of late*

Sentiment in the German economy, having hit new record highs in the second half of last year before deteriorating markedly during the first few months of 2018, stabilised somewhat in the period under review. While the business situation was still considered to be very positive according to the Ifo surveys, business expectations fell to their longer-term average. This was mainly because enterprises in the wholesale and retail trade were taking a more cautious view of the future. By contrast, expectations in the other service sectors brightened slightly. The business outlook in the manufacturing industry has been stable in recent months, and the sector's assessments of short-term output and export expectations also remained largely unchanged. Developments in the main construction industry stood out positively, however. Not only did the assessment of the business situation jump to a new record high, expectations also brightened distinctly.

*Order situation still favourable*

German industry's order books are still well filled. The decline in industrial orders since the beginning of the year must be viewed in the context of the exceptionally strong inflow of orders in the second half of 2017 and the only subdued growth in output in the first half of this year. In regional terms, businesses received considerably fewer orders in the second quarter particularly from the euro area and Germany. By contrast, the inflow of new orders from non-euro area countries increased substantially. However, order backlogs in the

### Demand for industrial goods and construction work

Volume, 2015 = 100, seasonally adjusted, quarterly

Source of unadjusted figures: Federal Statistical Office. **1** Only calendar-adjusted.  
 Deutsche Bundesbank

manufacturing sector were still viewed as being well above average, according to the Ifo Institute surveys. The reported range of orders also remained close to its historical record high in the reporting period. Moreover, the order backlog in June was significantly higher than the average of the first quarter. The orders situation in industry can thus still be considered positive overall.

*Demand for construction services remains high*

The construction boom in Germany is likely to continue in the third quarter of 2018. Construction firms generally continue to enjoy very buoyant demand for construction services. On an average of April and May – the most recent months for which statistics are available – the order intake in the main construction sector went down steeply on the previous quarter. However, the inflow of new orders in the first quarter was exceptionally high and also, for the most part, characterised by large orders, which are often processed over longer periods of

time. The brisk construction demand was also reflected in considerable and broad-based growth in the number of building permits granted. In view of the capacity constraints in the sector, however, it remains to be seen how quickly and strongly high demand will push up production.

The prerequisites for private consumption to continue as a mainstay of solid economic growth remain in place in the third quarter of 2018. The recent improvement in the labour market situation was not as marked as that seen in 2017 but the outlook is still favourable. Moreover, significant price-adjusted wage growth is also likely to further increase households' scope for expenditure. In line with this, consumer sentiment is optimistic according to the consumer climate index compiled by the market research company Gesellschaft für Konsumforschung (GfK). The same applies to consumers' income expectations.

*Buoyant consumption continues*

## Public finances\*

### General government budget

*Public finances continuing to develop favourably in 2018 ...*

German public finances are continuing to develop favourably this year as well. The general government surplus is likely to keep rising (2017: 1.2% of gross domestic product (GDP)). The debt ratio is decreasing and is expected to come close to the 60% threshold by the end of the year. It fell to 62.9% in the first quarter, down from 64.1% at the end of 2017.

*... due to expansionary measures being slightly outweighed by positive effects*

Public finances are benefiting from the favourable economic situation. In addition, temporary burdens are declining due to the nuclear fuel tax repayment in 2017 being a one-off event. Irrespective of the cyclical upswing, the favourable growth trend is giving rise to significant revenue increases. Growth is being further amplified by overall progressive taxation. On the expenditure side, this is being supported by falling interest payments and structurally positive labour market developments. However, spending is set to rise fairly significantly in a variety of other areas. For instance, payments to the EU are likely to go up considerably, while marked spending increases in the areas of investment, long-term care and healthcare are also expected.

*Fiscal loosening will cause surplus to decline in coming years*

As things stand, the framework conditions for public finances will remain favourable in the medium term. However, the surplus could well shrink in the coming years as the Federal Government is planning to raise spending in numerous areas. The tax and social contributions ratio may change very little – on the one hand, income tax, the solidarity surcharge and the contribution rate for the unemployment insurance scheme are set to be reduced but, on the other hand, an increase in the contribution rate for the long-term care insurance scheme is envisaged, and bracket creep in income taxation will generate additional revenue. Fiscal loosening is also in the offing for state and local governments, which have run surpluses for many

years. Overall, fiscal policy is likely to be clearly expansionary as a result. Given that economic conditions are favourable, the effect of this will be procyclical. As things currently stand, however, the risk of this giving rise to cyclical excesses such as increased price pressures appears limited overall. This notwithstanding, government investment in construction, to give one example, will have to be monitored so that additional spending does not dissipate in the face of price increases.

Looking further ahead, public finances will be faced with various challenges, especially that of demographic change. It will cause spending to soar and dampen revenue growth. To this extent, it is a welcome sign that the debt ratio is currently being rapidly reduced. The lower interest burden associated with a low debt ratio provides some breathing space, making it possible to shoulder increasing demographic burdens. This will be important, in particular, even when interest rates go up again.

The very favourable budgetary situation overall is due not least to positive economic and labour market developments. In view of the high surpluses, however, fiscal policymakers are also under pressure to provide additional public services. The measures currently being rolled out are initially focusing on additional transfers. Means testing is not of primary importance here (as it is, for example, in the case of mothers' pensions or home buyers' child benefit). The scope for spending in other areas – such as education, digitalisation or transport infrastructure, which constitute important cor-

*Demographic challenges easier to overcome with low debt ratio*

*Spending to initially focus on transfers*

\* The section entitled "General government budget" relates to data from the national accounts and the Maastricht debt ratio. This is followed by more detailed reporting on budgetary developments (government finance statistics). As yet, there are no current quarterly data available for local government or the statutory health and public long-term care insurance schemes. These will be discussed in the short commentaries in subsequent editions of the Monthly Report.

nerstones for economic growth – is thus lower. In addition, the tax and social contributions ratio remains quite high as plans currently stand and will come under substantial upward pressure going forward as taxes and social contributions will be used to finance additional spending in the face of demographic change. Should there be any additional fiscal space available, it would therefore be worth exploring cuts in taxes and social contributions for employees and enterprises rather than expanding transfers.

*Planned pension policy measures will increase pressure resulting from demographic trends*

The financial challenges arising in connection with demographic trends will increase as a result of current pension policy. The Federal Government's first pension benefits package is set to focus on expanding benefits (particularly mothers' pensions) that are not funded by dedicated social contributions. The lion's share of these costs will initially be borne by contribution payers. However, whenever additional spending on non-insurance-related benefits is approved – to meet certain distribution targets, for instance – it should be financed in a rule-based manner out of general taxation. This is designed, not least, to combat the tendency to exploit the sound state of the social security funds' finances for non-insurance-related purposes.

It is important to quickly reach a consensus on the planned fundamental pension reform so as to provide some certainty over the longer term. The main levers for tackling the demographic burden on the pension insurance scheme are the pension level, the statutory retirement age, the contribution rate and the central government grant. At present, there is considerable opposition to further raising the statutory retirement age. At the same time, there are often calls to set a high floor for the pension level and a low cap for the contribution rate. The funding gap that this would open up would then have to be plugged by higher central government grants. It would appear here that central government's ability to shoulder such a burden is sometimes clearly overestimated – not least on account of the still highly favourable budgetary situation, presumably. Central government grants are already set to rise sharply in response to the current legal situation, however, which will increase their share in both central government spending and pension revenue. Private pension arrangements also require a reliable planning basis. It is therefore important to quickly reach an agreement on a burden-sharing plan that will be sustainable in the long term.

*Put pension finances on sound footing and improve planning certainty*

## Budgetary development of central, state and local government

### Tax revenue

Year-on-year growth in tax revenue<sup>1</sup> came to 10½% in the second quarter of 2018 (see the chart above and the table on page 59). Excluding the previous year's repayment of nuclear fuel tax amounting to €6½ billion,<sup>2</sup> growth still

*Extraordinary rise in tax revenue in Q2 owing to one-off effect in previous year*

<sup>1</sup> Including EU shares in German tax revenue but excluding receipts from local government taxes. The latter are not yet known for the quarter under review.

<sup>2</sup> In its ruling 2 BvL 6/13, the Federal Constitutional Court declared nuclear fuel tax unconstitutional and ordered central government to repay all payments collected to the operators of nuclear power plants. The aforementioned repayment, made in June last year, was followed in August 2017 by a further amount of €1 billion for accrued interest.

Tax revenue									
Type of tax	H1				Estimate for 2018 <sup>1,2</sup>	Q2			
	2017	2018	Year-on-year change			2017	2018	Year-on-year change	
	€ billion	€ billion	€ billion	%	%	€ billion	€ billion	€ billion	%
Tax revenue, total <sup>2</sup>	326.4	350.2	+ 23.8	+ 7.3	+ 5.3	161.0	178.1	+ 17.1	+ 10.6
<i>of which</i>									
Wage tax	93.6	99.5	+ 5.9	+ 6.3	+ 5.6	48.3	51.4	+ 3.1	+ 6.5

Turnover taxes <sup>5</sup>	111.7	115.0	+ 3.3	+ 3.0	+ 3.8	54.2	55.8	+ 1.6	+ 2.9
Other consumption-related taxes <sup>6</sup>	42.0	42.1	+ 0.1	+ 0.3	+ 0.6	22.1	22.1	- 0.0	- 0.0

Sources: Federal Ministry of Finance and Bundesbank calculations. 1 According to official tax estimate of May 2018. 2 Including EU shares in German tax revenue but excluding receipts from local government taxes. 3 Employee refunds deducted from revenue. 4 Withholding tax on interest income and capital gains, non-assessed taxes on earnings. 5 Turnover tax and import turnover tax. 6 Taxes on energy, tobacco, insurance, motor vehicles, electricity, alcohol, air traffic, coffee, sparkling wine, intermediate products, alcopops, betting and lottery, beer, fire protection.

Deutsche Bundesbank

stood at 6½%. But this figure, too, is likely to be somewhat overstated: it is based, *inter alia*, on high additional revenue from non-assessed taxes on earnings. Earlier profit distributions (compared with last year) probably have a part to play in this. As such, a countermovement is expected in the coming months.

Considerable growth expected for year as a whole

The Working Party on Tax Revenue Estimates projects revenue growth (including local government taxes) of 5% for the year as a whole. Excluding the one-off effect of the nuclear fuel tax repayment, the growth rate would stand at 4%. Growth will be slightly depressed owing to other court rulings that are forecast to result in tax repayments later in the year. In addition, there will be revenue shortfalls stemming from legislative changes: income tax cuts, in particular, will reduce revenue. By contrast, lapsing refunds of corporation tax credit<sup>3</sup> will lead to an increase in revenue.

The tax estimate indicates that in the medium term, too, tax revenue will rise considerably and the tax ratio will go up. Although the planned income tax and solidarity surcharge cuts have not yet been taken into account, the ratio would probably remain at a historically high level even if they were. Additionally, more tax revenue will be needed in the longer term: it is foreseeable that demographic developments will put considerable funding pressure on the central government budget. In view of the calls for permanent increases in grants to the statutory pension insurance scheme, this pressure could intensify further. With that in mind, it should not be forgotten that rising taxes and social contributions could be detrimental to economic growth, the labour market and investment.

High tax ratio and further upward pressure

<sup>3</sup> This credit was the result of switching from a full imputation system to the half-income method as part of the corporate tax reform of 2000-01. Refunds were staggered between 2008 and 2017.

### Central government fiscal balance\*

€ billion

Source: Bundesbank calculations based on data from the Federal Ministry of Finance. \* Core budget excluding off-budget entities. Not adjusted for financial transactions or cyclical effects. Deutsche Bundesbank

*Corporate tax burden in Germany becoming less advantageous by international standards*

Corporate tax rates are an important part of the decision on where to locate and invest, and enterprises also respond to differences in corporate tax rates from one country to the next.<sup>4</sup> The United States recently cut statutory and effective tax rates for corporations to levels well below those in Germany. On a scale of EU countries' corporate tax rates, Germany already ranks in the top quarter at this time.<sup>5</sup> Some EU countries have announced tax cuts, including countries with relatively high corporate tax rates. But other factors do also play a role in investment decisions. As Germany is a major economy and an oft-attested top-quality business location,<sup>6</sup> a level of taxation that is slightly above average does not appear problematic *per se*. In this respect, it is necessary to maintain that general high level of quality in the long term and cater to new requirements in good time. That said, it is important to also keep an eye on tax competitiveness and, if need be, fine-tune it if the gap between corporate tax rates becomes too great.

## Central government budget

Central government generated a large surplus of €14½ billion in the second quarter of 2018. The budget outturn was €13 billion higher than in the second quarter of 2017. This was partly due to the nuclear fuel tax repayment of €6½ billion in 2017, which pushed down tax revenue that year, being a one-off event. Tax revenue also increased significantly, besides. By contrast, expenditure fell slightly. Amongst other things, interest expenditure declined, particularly in connection with inflation-linked Federal securities. There was also a transfer to the energy and climate fund in the second quarter of last year which was not repeated this year. A surplus of €18 billion was recorded for the first half of 2018 as a whole, which was also well up on the previous year's level (€6½ billion).

*Sharp rise in surplus, also as a result of one-off effect*

By contrast, the recently adopted budget plan envisages a significant deterioration in the outturn for 2018 as a whole (€7 billion decrease compared with the surplus in 2017). A deficit of €2 billion was estimated. In order to maintain a balanced budget (ie avoid net borrowing), the government is entitled to use, first and foremost, the refugee reserve (see the excursus on pages 69 to 73 on the use of reserves and off-budget entities).

*Nevertheless, balance set to clearly deteriorate according to 2018 budget plan ...*

As the plans stand, the debt brake will be undershot by some way (see the table on page 61). The Federal Ministry of Finance links the ceiling to the level of structural net borrowing, which is lowered by making reserve with-

*... but debt brake will still be clearly undershot*

<sup>4</sup> This is suggested by empirical evidence. See, inter alia, RA de Mooij and S Ederveen (2008), Corporate tax elasticities: a reader's guide to empirical findings, Oxford Review of Economic Policy 24(4), pp 680-697; or LP Feld and JH Heckemeyer (2011), FDI and taxation: a meta-study, Journal of Economic Surveys 25(2), pp 233-272.

<sup>5</sup> For comparisons of the effective average tax rates and the cost of capital, see C Spengel et al (2018), Analysis of US corporate tax reform proposals and their effect for Europe and Germany: final report – update 2018.

<sup>6</sup> See, for example, World Economic Forum (2017), The Global Competitiveness Report 2017-2018.

Deutsche Bundesbank

drawals.<sup>7</sup> Due to favourable economic conditions, the structural balance is less favourable than the unadjusted one. Including the relevant off-budget entities, structural net borrowing amounts to €3½ billion. Nevertheless, the upper limit of 0.35% of GDP will still be clearly undershot.

The budget appears very prudent. Recent, highly favourable developments indicate a significant surplus. For example, investment expenditure<sup>8</sup> in areas such as expanding the broadband network or calls on guarantees could once again be lower than estimated. Additionally, surging transfers to the energy and climate fund were earmarked. It seems plausible here that these outflows will be notably lower, even over the remainder of the year. A planned global revenue shortfall of €1½ billion was not explained in any detail. The usual general global spending cut (2017: €2 billion) was struck from the record. If expenditure appropriations are not fully utilised in the

course of implementing the budget, the outturn will thus immediately be better than planned as it will not first be netted against a global expenditure cut. All in all, there could be a similarly high surplus as in the previous year rather than the significant deterioration that was envisaged. As a result, the reserve is likely to keep swelling substantially in size rather than being depleted as planned.

The draft budget for 2019 was approved by the Federal Cabinet at the start of July. Compared with the 2018 budget estimates, expenditure is expected to rise by almost 4% (€13 billion), with additional funds earmarked for defence and the statutory pension insurance scheme, in

*Draft budget for 2019 sets out marked expenditure growth ...*

<sup>7</sup> By contrast, the deficit cannot be lowered by dissolving reserves. For more details, see Deutsche Bundesbank, Key central government budget data in connection with the debt brake, Monthly Report, February 2016, pp 68-69.

<sup>8</sup> Pursuant to the Budget Principles Act (Haushaltsgrundsatzgesetz), investment expenditure includes fixed asset formation, acquisitions of financial assets (loans and shareholding acquisitions), calls on guarantees and financial assistance (intergovernmental and other investment grants).

*Plan very prudent, and renewed surplus to be expected*

particular. Spending increases on transport are subdued, despite there being additional revenue from the heavy goods vehicle toll available: the toll rates are set to be increased significantly, and the toll was extended to all federal trunk roads from July 2018. Global additional expenditure of €2½ billion was estimated for projects that have not yet been specified by the Federal Government.

*... and considerable burdens on revenue side*

Tax revenue growth of €11½ billion is envisaged on the revenue side. This increase will be dampened by the fact that transfers to the EU budget are forecast to be significantly higher again. In the budget, these are deducted from tax revenue. Furthermore, the planned Family Relief Act (*Familientlastungsgesetz*)<sup>9</sup> is factored in, with revenue shortfalls of €2 billion. As yet unspecified budgetary burdens are taken into account in the form of a single global revenue shortfall item of €7 billion.<sup>10</sup> It is not explained in any further detail and goes far beyond the scope of the priority projects agreed as part of the coalition deal.

*Compliance with debt brake only ensured by planned reserve withdrawal, but outturn will probably be more favourable*

All in all, a deficit of €5½ billion is estimated for 2019. This, too, is set to be financed mainly by tapping the refugee reserve in order to avoid net borrowing (see the table on page 61). Structural net borrowing will rise to €10 billion. The main reason for this is the deficit recorded by off-budget entities. The outturn will deteriorate significantly in year-on-year terms due to the digitalisation fund no longer receiving a transfer. In addition, cyclical budget relief is set to intensify further. The margin below the debt brake limit will therefore amount to no more than just over €1 billion. If no recourse were made to the reserve, the threshold would be exceeded. That said, the outturn will probably be more favourable than planned in 2019, too. One reason for this is that the significantly better outturn in 2018 is expected to continue making itself felt as a baseline effect. As things currently stand, the global precautionary items will not be needed in the budgeted amount either. Overall, another surplus in the core budget is therefore possible. This would result

in the reserve being topped up again rather than being reduced.

According to the budget plans for 2018 and 2019, significant fiscal loosening is in the offing. Thus, the structural balance will decrease by €8½ billion in 2018 compared with 2017, and by another €10 billion in 2019 compared with 2018 (see the table on page 61). Such a fiscal stimulus will have a procyclical effect on the back of the very favourable economic situation and cyclical developments that are expected. However, the associated risks to stability policy seem to remain limited. This is due to the fact that price pressures will be contained overall, even taking this stimulus into account. The risk of other stronger cyclical excesses likewise seems limited. In addition, more favourable budgetary developments remain likely, as previously mentioned, with the result that fiscal loosening will be more modest than planned.

*Plans for 2018 and 2019 indicate significant fiscal loosening*

The enduring objective of the medium-term fiscal plan for 2020 to 2022 is to achieve a balanced budget (ie no net borrowing). In the final year, reserves are to be topped up again slightly on balance and the positive effect of the economic cycle is expected to have come to an end. To this extent, the plan is to reduce structural deficits. In the case of taxes, bracket creep will bring in a marked increase in revenue. However, this will be counterbalanced by growing shortfalls stemming from the Family Relief Act and, from 2021 onwards, the partial abolition of the solidarity surcharge. Moreover, provisions appear to have been made for a further increase in child benefit, which was outlined in the coalition agreement, and additional

*Fiscal plan up to 2022 without net borrowing and with provisions for tax relief measures ...*

<sup>9</sup> This contains the child benefit expansion in 2019 that is enshrined in the coalition agreement. Furthermore, higher basic tax allowances and compensation for the estimated effects of bracket creep in 2018 and 2019 are planned.

<sup>10</sup> This probably includes central government grants for state and local governments to cover some of the integration costs for refugees. These will be deducted from central government tax revenue this year (€2 billion annually). These payments were initially only agreed until 2018, but they will now be continued as set out in the coalition agreement. They were not factored into tax revenue, however, as draft legislation on this matter was not yet available.

income tax cuts. The latter are likely to concern raising the basic income tax allowance up to the minimum subsistence level and continuing to offset bracket creep. The sum of these tax measures was adequately taken into account by global revenue shortfalls. These will increase to €17½ billion up to 2021 before falling to €15 billion in 2022. However, this means that the global revenue shortfalls will no longer have a lot to offer in terms of room for fiscal manoeuvre, particularly since the Bundesbank's profit has been budgeted at the maximum amount of €2½ billion.

*... amid only moderate expenditure growth*

According to the fiscal plan, expenditure (excluding allocations to reserves) will increase by 1½% per year, which marks a substantial slowdown compared with previous years. These rises are significantly lower than anticipated nominal GDP growth and will thus make it possible to scale back the structural deficit. Funds have been primarily set aside for the Federal Ministry of Labour and Social Affairs, more specifically for the pension insurance scheme. Additionally, it is envisaged that a reserve for demographic challenges will receive a new allocation in the amount of €2 billion per year from 2021. This should offset agreed additional pension insurance scheme burdens until 2025 and, in particular, in 2025. Most other ministries' budgets will all but stagnate. A number of priority projects from the coalition agreement still appear to be part of the departmental budget "General financial administration", however. These include, for example, a higher intergovernmental grant to expand childcare facilities.<sup>11</sup> Interest expenditure is expected to rise moderately up until the final year. Thus, provision has been made for a certain interest rate rise.

*Additional leeway possible, but also additional burdens and risks*

Overall, a certain amount of additional leeway could emerge during the fiscal planning period if the more favourable developments of the preceding years continue to make themselves felt as a baseline effect. In case of such a scenario, it was announced that development aid and defence expenditure would be increased. Planned expenditure relative to GDP in these

areas appears to be lagging behind the amounts set in international agreements, and is even declining in some cases. Additional needs may also arise when it comes to payments to the EU; in the context of Brexit, for example. The fact that the solidarity surcharge is only to be abolished in part is sometimes regarded critically under current constitutional rules. However, were it to be completely abolished, the result would be an additional financial requirement of around €12 billion in 2021. There are also certain risks in connection with the macroeconomic outlook: the assumed GDP growth rates seem plausible, but compared to estimates by other institutions, potential output and its rate of growth are set at a fairly high level. This means there is a danger of the favourable cyclical impact being increasingly underestimated and the structural situation being reported too positively. Risks are also posed by factors such as greater trade protectionism, and by renewed tensions within monetary union.

In the longer term, demographic change is set to be one of the greatest challenges facing the central government budget. The associated burdens are likely to have been sufficiently taken into account in the fiscal planning period up to 2022. There is, however, a risk of sharply increasing burdens over time. Central government grants to the statutory pension insurance scheme are already set to rise substantially under the current legislation. This means that central government will fund an ever greater proportion of the scheme with tax revenue.<sup>12</sup> This proportion would be greater still if additional demographic burdens of the pay-as-

*Demographic challenges in the long term*

<sup>11</sup> This constitutes an expansion of mixed financing, which, as a rule, should be viewed critically. See Deutsche Bundesbank, Public finances, Monthly Report, May 2018, p 70.

<sup>12</sup> This is also on account of the fact that central government grants are likely to increase at a faster pace than contribution receipts. A large proportion of the central government grant will be increased in line with per capita wages (and the contribution rate). By contrast, contribution receipts grow along with gross wages and salaries (and also the contribution rate). The foreseeable demographic decline in employment will therefore dampen contribution receipts, but not the central government grant.

you-go pension system were to be transferred to central government. Such would be the case if the stringent limits set for the pension level and the contribution rates were to remain in force after 2025. The scope for forward-looking expenditure would then shrink considerably, and tax increases would be inevitable.

*Transparency of plans substantially impaired*

Central government's budgetary and fiscal plans are becoming increasingly difficult to follow. A medium-term analysis is particularly challenging as important aspects have not been illustrated in a transparent manner. An example of this is information relating to the debt brake. Compliance with the debt brake cannot be assessed unless the budget estimates for all relevant items are shown. However, data are still missing for most of the off-budget entities.<sup>13</sup> Furthermore, a detailed explanation for, in some cases, very extensive global revenue shortfall and expenditure increase items would be needed to evaluate risks and budgetary buffers. In addition, the increasing number of reserve pots, the planned allocations to and withdrawals from these, and their levels would have to be clearly shown.

*Potentially stable surplus for the year for off-budget entities*

Central government's off-budget entities<sup>14</sup> recorded a surplus of €1½ billion in the second quarter of 2018, compared with a figure of €2 billion in the same period last year. Lower central government grants had a negative effect. A marked surplus is expected once again for the year as a whole (2017: €3 billion). The fund to promote municipal investment may conclude the year with a somewhat larger deficit. Higher payouts are now expected from this fund since the conditions for funding investment in schools have been agreed on. Last year's surplus of €1½ billion for the repayment fund for inflation-linked Federal securities is not likely to be replicated, chiefly because a bond had to be repaid this year. Central government's current transfers were also somewhat smaller as a result of decreased price pressures. The planned digitalisation fund, by contrast, is set to have the opposite effect. It is planned to pre-finance this fund with €2½ billion from the central gov-

ernment budget. These financial resources will only be called upon in the coming years.

## State government budgets<sup>15</sup>

In the second quarter of 2018, state governments achieved a very high surplus in their core budgets amounting to just over €11½ billion. The financial situation therefore improved considerably compared with the result of the same period last year (+€2½ billion). Revenue rose by 9%, significantly more strongly than in the first quarter. The fine that Volkswagen was required to pay on account of the diesel scandal had a positive impact in Lower Saxony (€1 billion). Expenditure, by contrast, declined by 1½%, mainly because a shift in North Rhine-Westphalia during the course of the year decreased other expenditure.<sup>16</sup> Personnel expenditure – a major component of state government spending – showed only weak growth. Transfers to local government and other operating expenditure, conversely, increased strongly.

*Financial situation significantly improved again in Q2, also due to one-off effects*

Overall in the first half of the year, the surplus increased significantly to €18 billion. As the year progresses, however, various negative factors will take effect. Schleswig-Holstein and Hamburg are anticipating extensive calls on guarantees from their Landesbank.<sup>17</sup> In North Rhine-Westphalia, a negative countermovement resulting from the rescheduled payment, as mentioned above, will make itself felt in a year-on-year comparison. In addition, the

*High surplus foreseeable for year as a whole*

<sup>13</sup> A medium-term financial plan has only been drawn up for the energy and climate fund.

<sup>14</sup> In line with the Federal Ministry of Finance's quarterly overviews. These notably do not include bad banks and other entities keeping commercial accounts. The refugee reserve is not considered to be an off-budget entity.

<sup>15</sup> The following data are based, unless other sources are stated, on the monthly cash statistics for the core budgets.

<sup>16</sup> Grants to universities were brought forward to the second quarter last year (approximately €2 billion).

<sup>17</sup> On account of transactions with their Landesbanken, in the second half of the year the state governments could face a burden that is €6 billion higher, on balance, than in 2017. Aside from developments in the above-named federal states, a now lapsed capital repayment from BayernLB in 2017 also played a role.

growth in tax revenue is likely to slow markedly, according to the tax estimate. Personnel expenditure, on the other hand, is set to rise significantly more strongly, according to the June projection for the Stability Council. For the year as a whole, the surplus could nevertheless be close to the record level (€14 billion) achieved in 2017.

*Medium-term outlook remains very positive*

In the medium term, conditions are set to remain favourable for state government finances. This is particularly the case for tax revenue, which is expected to continue to increase significantly. Additionally, central government will continue to provide funds for the integration of refugees, for instance. This means that, on balance, the burdens resulting from the planned Family Relief Act will probably be more or less offset. Further strong growth in pension expenditure is on the horizon in the years to come, and the relief provided by the positive economic situation also has to be factored out. On the whole, however, there is sufficient budgetary leeway to focus on the areas of need with future benefits identified by many state governments. These areas include, in particular, education and childcare facilities, infrastructure, internal security and strengthened administration. Central government projects, such as the digitalisation of schools and all-day childcare for children of primary school age, provide additional support here. Conditions are also favourable for local government finances. This equally presents an opportunity to correct structural imbalances while conditions are good – potentially with targeted support from state government.

*Bremen and Saarland just keeping within structural deficit limits*

The Stability Council established at the end of June that the five federal states in receipt of consolidation assistance had fulfilled their obligation to reduce their deficits in 2017 as well.<sup>18</sup> However, Bremen's safety margin now appears to be very small. In Saarland, funds were set aside for a "rainy day", on the one hand, which reduced the safety margin. On the other hand, loss compensation was recorded as financial transactions, meaning that the structural

budget outturn looked more positive. Most state governments now have sufficient financial leeway to absorb nationwide tax cuts or unforeseen negative developments. However, this will probably not be the case going forward, particularly in Bremen and Saarland. But from 2020 onwards, both states are to receive more extensive financial aid from central government for at least fifteen years (€400 million each). These funds will have only low debt redemption obligations attached. This will give Bremen and Saarland additional budgetary leeway, but will also weaken their incentives to run an autonomous and sustainable budgetary policy.

<sup>18</sup> The federal states of Berlin, Bremen, Saarland, Saxony-Anhalt and Schleswig-Holstein are receiving consolidation assistance for the years 2011 to 2019. The payments amount to a total of €800 million per year. To qualify for this assistance, the federal states have to eliminate their structural deficits by at least reducing them in equal increments along a single path by 2020. Central government and the state governments as a whole each provide half of the financial resources.

## Finances of the German statutory pension insurance scheme

Considerably higher surplus in Q2 ...

## Social security funds

### Statutory pension insurance scheme

The favourable developments in the finances of the statutory pension insurance scheme continued in the second quarter of 2018. At €2 billion, the surplus was more than twice as high as one year earlier. Total revenue continued to rise sharply, by 4½%. Contribution receipts increased somewhat more strongly again in spite of the slight reduction in the contribution rate at the beginning of the year (0.1 percentage

point). This reflects the positive employment and wage developments. Expenditure grew by 2½%. This is primarily due to the pension increase in mid-2017, which amounted to an average of just under 2½% for Germany as a whole.

Growth in pension payments is likely to gain momentum over the course of the year. Although the number of pensions paid continues to increase at just a subdued pace, the mid-year pension adjustment in 2018 was perceptibly higher than in the previous year, at just under 3½%.<sup>19</sup> Nonetheless, revenue will probably continue to rise faster than expenditure. A distinctly higher surplus than in 2017 is therefore on the cards for the year as a whole (€½ billion).

Pension finances will benefit from the expected positive developments in wages and employment in the medium term, too. It would be possible to considerably reduce the contribution rate again next year if no further interventions are made in the meantime. The draft bill prepared by ministry officials for the first pension benefits package<sup>20</sup> puts the potential contribution rate cut at 0.3 percentage point (€3½ billion). In the first few years, however, the extensive benefit expansions provided by this package are largely to be financed by increased contributions. In a first step, therefore, a possible reduction in the contribution rate is being avoided.

... and probably in year as a whole, too

Benefit expansion rather than possible contribution rate cut in 2019

Higher benefits for different groups, and limits set for pension level and contribution rate

The pension benefits package is intended to take effect as of 2019. Mothers with children born before 1992 are to receive increased mothers' pensions. In addition, new pensions for persons with reduced earning capacity are

<sup>19</sup> On 1 July, pensions were raised by 3.22% in the west German states and 3.37% in the east German states.

<sup>20</sup> Draft bill prepared by ministry officials of the Federal Ministry of Labour and Social Affairs for the Act on Improvements in Benefits and Stabilisation of the Statutory Pension Insurance Scheme (Gesetz über Leistungsverbesserungen und Stabilisierung in der gesetzlichen Rentenversicherung) of 12 July 2018.

set to be higher. In the case of “midi-jobs”,<sup>21</sup> social security contributions will be reduced for those earning a monthly wage of up to €1,300 (as opposed to €850 up to now). Furthermore, pension entitlements from midi-jobs are to be upgraded. This means that pension entitlements will no longer be derived solely from the reduced but the assumed full contribution level. Finally, new limits will be set for the pension level<sup>22</sup> and the contribution rate (a measure referred to as the “double limit”) up until the end of 2025. The pension level may not fall below 48%, and the contribution rate is not to exceed 20%. It is intended to plug any funding gap with additional central government grants.

tribution (albeit significantly smaller) to the agreed expansion of benefits. However, the increase in mothers’ pensions and decreased contributions for midi-jobs can be classified as non-insurance-related benefits (€4 billion per year). As such, it would be appropriate to fund these benefits with additional central government grants, and thus with general tax revenue, by extension.<sup>24</sup> However, central government’s additional burdens amount to only around €1 billion on average each year between 2019 and 2024. Only in 2025 will they rise significantly to €5 billion, as the contribution rate would otherwise increase to over 20%.

*Additional expenditure on mothers’ pensions in particular*

The financial impact of individual measures up to 2025 is set out in the draft bill. The additional annual costs for mothers’ pensions are estimated to be €3½ billion. The reduced contribution for those with low incomes is forecast at just under €½ billion. The increased spending on pensions for persons with reduced earning capacity is to rise gradually, reaching €1 billion in 2025. However, no potential changes in behaviour resulting from the more advantageous new rules have been taken into account. The total cost of the above measures will initially be €4 billion per year. This will increase to €5 billion by 2025.

Overall, the package places a considerable burden on pension finances, mainly on account of the expansion of mothers’ pensions. As a result, the financial leeway for other government priorities currently under discussion is reduced. The special benefit expansions are not means-tested. While the current favourable budgetary situation will ensure that the additional financial burdens are likely to make less of an initial impact, spending on pensions will increase in structural terms, although expenditure will face strong demographic pressure in any case.

*Further complications in overcoming foreseeable demographic burdens*

*Additional non-insurance-related benefits chiefly financed by higher contributions*

By far the largest share of the additional burdens on the statutory pension insurance scheme will be financed by contributions up to 2025 (based on the burdens cumulated up to that point). Without the pension benefits package, the contribution rates would be below 20% up to and including 2025, according to the projection. The package generally results in a markedly higher contribution rate, which will reach the 20% limit in 2024. A higher contribution rate also results in a lower level of pension growth when the pension adjustment formula is applied. According to the draft bill, the pension level will already have reached the limit by 2022. Without the package, this would only have been the case in 2024.<sup>23</sup> Consequently, pensioners are also to make a financial contri-

Future pensions for persons with reduced earning capacity will be significantly increased. In some cases, they will be substantially higher

<sup>21</sup> Midi-jobs are forms of employment for which the monthly wages usually lie between €450 and €850. In this area, certain reductions have been granted for social security fund contributions (section 20 (2) of the Fourth Book of the Social Security Code (Sozialgesetzbuch IV)). However, this has also meant lower pension entitlements up until now.

<sup>22</sup> The pension level is the ratio of the current standard pension (given respective average earnings subject to insurance contributions over 45 contribution years) to current average pay. Income before taxes but less the relevant social contributions is used.

<sup>23</sup> The envisaged adjustments to the contribution rates for the public long-term care and unemployment insurance schemes have not yet been included. They will reduce the pension level.

<sup>24</sup> Generally speaking, it would be desirable to define those benefits regarded as non-insurance-related, and to finance them with central government grants in a rule-based manner. This would enhance transparency and clarity. The fact that the classification of individual benefits is not always straightforward should not hinder this.

### Finances of the Federal Employment Agency\*

Source: Federal Employment Agency. \* Federal Employment Agency core budget including transfers to the civil servants' pension fund.  
 Deutsche Bundesbank

*Future pensions for persons with reduced earning capacity substantially higher than regular early retirement pensions in some cases*

than regular early retirement pensions. This increases the incentive to exploit pensions for people with reduced earning capacity so as to retire early. From now on, it will be even more important to make provision for this. People working in professions which are detrimental to their health are intended to benefit from increased pensions for reduced earning capacities. In this respect, concerns regarding a rising statutory retirement age have been taken into account, and this issue should therefore be regarded as less problematic.

The reduced contribution rate for those in mid-jobs will make this form of employment more

attractive. The impact on the total number of hours worked, however, is unclear and is likely to be marginal. Only part-time employees will benefit from the reform, regardless of their hourly pay rate and of any other sources of income. The main criticism of the new mid-job rules appears to be that full pension entitlements are to be accrued despite the reduced contributions, thereby breaching the principle of equivalence. Furthermore, this subsequent preferential treatment is not precisely based on means testing at the time the pension is drawn, and there are likely to be "free-rider" effects.

*Midi-job reform unlikely to be focused*

Serious financial problems are set to arise within the statutory pension insurance scheme as a result of demographic trends, particularly after 2025. Key variables therefore need to be adjusted to ensure the sustainability of the scheme. However, the relevant fundamental decisions have been put off for the years to come. A pensions commission was tasked with the preparations in the first instance. The cost trends and burden-sharing expected in the long term must be presented in a transparent manner if a sustainable solution is to be found. In addition, all material parameters of pension finances should be regarded as parts of an interconnected system. Aside from the pension level, contribution rates and central government grants, this also includes the statutory retirement age, which has already been linked to life expectancy in other countries. It would also make sense to take longer contribution periods into account when calculating the pension level, as these are set to increase in step with a rising statutory retirement age and will increase the level of benefits.<sup>25</sup>

*Measures to stabilise pension finances necessary after 2025*

## Federal Employment Agency

In the second quarter of 2018, the Federal Employment Agency posted a surplus of al-

<sup>25</sup> See Deutsche Bundesbank, Excursus: longer-term pension developments, Monthly Report, August 2016, pp 68-77. For the burden on the central government budget, see also p 63 f. of this report.

*Surplus at previous year's level in Q2*

most €1½ billion in the core budget.<sup>26</sup> This stood just around the level of the previous year. As in the first quarter, a higher special transfer to the civil servants' pension fund<sup>27</sup> placed a strain on the Federal Employment Agency's finances compared with the previous year.

*Strongly increased contribution receipts amid declining operating expenditure*

As a result of a further steep rise in contribution receipts (5%), revenue increased by a total of 4%. Expenditure grew by 6½%. The increase was driven solely by additional payments to the civil servants' pension fund. In particular, expenditure on unemployment benefits and active labour market policies declined further (by around 3% in each case).

*Higher surplus and growing reserves foreseeable for the year as a whole*

Conditions are very favourable for the Federal Employment Agency's finances – employment is increasing, unemployment is declining and per capita earnings are rising more sharply. No further special transfers to the civil servants' pension fund have been planned for the second half of the year. Against this backdrop, a high surplus is also expected for this year. It could even exceed the prior-year figure of €6 billion, thus surpassing the budgeted amount of €2½ billion by a significant margin. The free reserves would rise to a record level of over €23 billion.

*Greater contribution rate reduction feasible*

The positive development on the labour market is likely to continue. High surpluses and increasing reserves are therefore still expected, even if the contribution rate is reduced from 3.0% to 2.7% in accordance with the coalition agreement. Even if spending were to increase somewhat – for active labour market policy measures, for example – the Federal Employment Agency's finances would still be able to cope with a lower contribution rate.

## Excursus: the use of reserves and off-budget entities by central and state government

### Current developments

Central government and numerous state governments have used the sound budgetary situation of the past few years to channel more funds into reserves and off-budget entities (special funds). Reserve funds were thus set aside to be used when needed in future.<sup>28</sup>

*Sound position used to set aside reserve funds*

However, this future use of reserves only expands budgetary scope if it is permitted under the debt brake rules. Central government links its debt brake to net borrowing. As net borrowing can be reduced by a withdrawal from reserves, it is easier to comply with the budget ceiling by using reserves. As for central government's off-budget entities, their inclusion in the debt brake varies. Here, it is possible to achieve the same effect as with reserves if the off-budget entities are not consolidated under the debt brake: pension funds, for instance, are not included in the debt brake. In other words, transfers of funds from central government are recorded as central government expenditure and, under the debt brake, restrict its budgetary scope in the same year. Subsequent pension payments from the off-budget entity are not recorded as central government spending, however. The situation is different for the newer off-budget entities, such as the fund to

*Varying effects in context of debt brake*

<sup>26</sup> Excluding the civil servants' pension fund. The transfers to the fund are recorded here as expenditure and reduce the core budget balance. Including the fund, the surplus amounted to €2 billion in the second quarter.

<sup>27</sup> The additional transfer totalled just under €1 billion, compared with a little under €½ billion in the same period last year.

<sup>28</sup> In most cases, no (financial) assets were set aside. In the central government budget, for example, topping up the refugee reserve was counted towards net borrowing in budgetary terms. In actual fact, however, the surpluses were used to repay debt. Ultimately, the refinancing of debt in the capital market was thus deferred. This occurs when, under the budget, funds are withdrawn from reserves without having to record net borrowing in the budget.

promote municipal investment or the planned digitalisation fund. These are included in the debt brake. Transfers from the core budget thus do not constitute a burden; overall, they do not change the sum of net borrowing in the core budget and the balances of the relevant off-budget entities – the relevant metric under the debt brake.<sup>29</sup> Subsequent outflows from the funds then constitute spending from the core budget in the context of the debt brake.<sup>30</sup> In contrast to reserves, then, when it comes to these consolidated off-budget entities, it is not possible to purposefully extend the debt brake limit using surpluses from previous periods when drafting the budget.

*Sizeable refugee reserve not needed for actual purpose, ...*

One important example of a reserve is the refugee reserve. It was established by central government at the end of 2015 and stocked up using budget surpluses.<sup>31</sup> Originally, its intended use was to cover budgetary burdens stemming from the heavy influx of refugees at that time. However, no funds have so far been withdrawn, even though this was regularly envisaged in the budget plans. On the contrary, the reserve was topped up with further surpluses and grew to €24 billion by the end of 2017. As things stand today, it is not needed for its original purpose. To date, it has been possible to cover refugee-related expenditure without using the reserve, and this expenditure is already declining markedly at the general government level.

*... but instead of being dissolved, it is now an instrument to finance new projects*

In keeping with the intention of the debt brake, it would thus be logical to dissolve the refugee reserve by budgeting for a debt repayment. But instead, it is being used as an additional budget instrument, serving as a general overflow pot for surpluses during the budget implementation phase. In subsequent periods, the cumulated funds allocated to the reserve make it easier to avoid net borrowing, as the budget plans make the reserve available to fund additional increases in expenditure or tax cuts, for example. The reserve thus allows central government to avoid net borrowing even in the

event of a fiscal loosening (see the table on page 61).

Another example at the central government level is the new arms reserve. If the funds approved in the budget for military procurements (€5 billion) are not fully tapped in the current year, the reserve will be topped up by up to €1½ billion in the event of a surplus. Moreover, €2 billion is to be channelled each year from 2021 to 2024 into a reserve set up for demographic challenges. This reserve is intended to cover central government's additional outlays in subsequent years stemming from the planned limits set for the pension insurance scheme up until 2025.

*Additional reserves planned at central government level*

At the state government level, not only different forms of reserves but also off-budget entities, in particular, are gaining in importance. The aim is for unused budgetary leeway to be carried over into the future. This appears to be possible because these entities are evidently not to be consolidated in the context of the relevant state government's debt brake.<sup>32</sup>

*Some state governments also have growing reserves*

---

<sup>29</sup> However, there is one difference regarding the supplementary objective of no net borrowing: since this objective relates to the core budget, it is harder to achieve when transferring funds to an off-budget entity, and easier when withdrawing funds.

<sup>30</sup> However, there is one difference in the budget implementation phase. If outflows from pre-funded off-budget entities turn out to be higher than estimated during budget implementation, no new borrowing authorisations are required. Additional expenditure of this kind is not restricted by the debt brake at that moment. In the central government budget, by contrast, new borrowing authorisations are restricted in the form of a supplementary budget: the standard limit may be exceeded by a maximum of 3% of the planned tax revenue. Each time the debt brake limit is exceeded during budget implementation (core budget and relevant off-budget entities taken together), however, the control account is debited (for more on the control account, see p 71).

<sup>31</sup> Plus central government's coin seigniorage. Certain state governments established similar reserves. These federal states sometimes ultimately transferred borrowing authorisations that were not needed when the budget was implemented to a reserve.

<sup>32</sup> This also applies to state governments receiving consolidation assistance. At the end of the last fiscal year, Berlin, Schleswig-Holstein and Saarland, for example, topped up off-budget entities intended to finance future investment.

## Difference from central government's control account

*Debt brake control account impaired by accumulation of reserves*

Under the debt brake, a control account was established for central government from 2011. At first glance, this resembles the aforementioned reserves, but in fact differs from them crucially. The debt brake stipulates a ceiling for central government's structural budget outturn (-0.35% of GDP). Positive and negative deviations from this ceiling during the budget implementation phase are added up on the control account.<sup>33</sup> A more favourable budget outturn thus results in a credit entry on the control account. However, a credit balance may only be used to offset unplanned breaches of the ceiling in the current fiscal year (during budget implementation).<sup>34</sup> The control account therefore is not designed to open up additional fiscal space in coming years. By contrast, the reserves and the central government off-budget entities not included in the debt brake (also called reserve funds from now on) explicitly aim to do this, and make it possible. When reserves are accumulated, the surpluses to be booked to the control account are accordingly lower.<sup>35</sup>

## Pros and cons of reserve funds

*Reserve funds can stabilise budgetary policy*

Reserves and off-budget entities excluded from the debt brake are budget instruments with specific pros and cons. It would be beneficial if they were used to further stabilise budgetary policy.

*Reserve funds can compensate for unpleasant surprises*

In good times, reserve funds can be topped up as a precaution against unpleasant surprises. Such surprises can have a serious impact, particularly when it comes to tax revenue. Often, they are not classified as cyclical by the conventional cyclical adjustment methods. Consequently, they affect the structural result, which is limited by the debt brake. Without reserve funds, an unexpected structural deterioration induced in this way would have to be fully compensated for when the next budget was drawn up, at the very latest, if the previous

financial plan had not included a safety margin below the debt brake ceiling.<sup>36</sup> A procyclical policy in bad times is more likely in the absence of safety margins.

Reserve funds can also be used to frontload the burdens stemming from spending programmes with uneven outflows, the timing of which is difficult to estimate (such as military procurements). When there is scope in the core budget, funds can be made available in advance which are then called upon if needed in future.

These potential benefits also stand in contrast to serious problems, however. Important budgetary principles, such as annuality and budgetary clarity, could be undermined. In particular, transparency can be lost if the plans become increasingly opaque due to numerous special pots. This is all the more true if overviews and information on key metrics are not provided or not provided in good time – or if these metrics can only be determined with some difficulty. Control by parliament and the general public can then be significantly impaired.

In particular, it is critical if structural imbalances are concealed by reserves. For instance, a structural spending increase or tax cut could initially be funded from a reserve. The politically difficult decision on counterfinancing could thus be shelved relatively unobtrusively. Only when the reserve is fully depleted would the need for consolidation come to light.

Off-budget entities are particularly problematic if they are used to take on extra-budgetary debt. This could result in the actual debt position being incorrectly assessed and risk being

*Better control of expenditure burdens in budget*

*Special pots may impair transparency and control by parliament and general public*

*Risk of budgetary imbalances being concealed*

*Taking on debt via off-budget entities could erode budgetary rules*

<sup>33</sup> For more details on the control account, see Deutsche Bundesbank, The debt brake in Germany – key aspects and implementation, Monthly Report, October 2011, pp 15-40.

<sup>34</sup> Budget legislators are obligated to make realistic budget estimates. Tapping the balance by making optimistic budget estimates should therefore remain restricted.

<sup>35</sup> In 2017, €5½ billion was transferred to the refugee reserve from the core budget outturn (total available funds: €24 billion). The control account was credited with €7½ billion from the remaining margin to the debt brake ceiling (credit balance: €18½ billion).

<sup>36</sup> See Deutsche Bundesbank (2011), op cit, p 32.

understated. Under certain circumstances, the normal budgetary rules could also be undermined. While central government has closed this previous loophole in the German Basic Law (*Grundgesetz*) for its own special funds, many state governments have not yet rigorously addressed this issue.

*Use of reserve funds could lead to conflict with European fiscal rules*

As the volume of reserve funds at the various levels of government rises, so too does the risk that the national rules no longer sufficiently safeguard compliance with the European rules. This safeguarding by means of the national rules is laid down in the Fiscal Compact and the Basic Law. Yet the national and European rules are not identical. The debt brake limits net borrowing by the relevant central and state governments, which is decreased by a withdrawal from reserves or shifting expenditure to off-budget entities excluded from the debt brake. On the other hand, the EU rules target the annual general government deficit (as defined in the national accounts), which is not positively affected by either of these actions.<sup>37</sup>

## Minimise problems with appropriate design

*Use rules to limit risk of reserve pots*

All things considered, the disadvantages of reserves and special funds described above seem quite serious. If these budget instruments are to be used nonetheless, the associated risks should be recognised and minimised by the rules on their application.

## Transparency and clarity

*Timely full disclosure and transparent planning important*

It is crucial that central and state governments disclose their special pots transparently, clearly and completely. The budgetary policy they are pursuing should also be well substantiated. The call for transparency applies to the short and medium-term plans, the budget implementation phase and the budget outturn. The relevant fund levels as well as the financial links to the core budget would have to be shown in a

timely manner using suitable overviews. There is considerable room for improvement here, for central government but especially for state government, too.

## Safeguard national fiscal rules

The standard limits imposed by the debt brake place relatively tight constraints on net new borrowing by government. In relation to the size of the economy, this is likely to further reduce debt, ie the debt ratio, significantly. This appears prudent as a precaution against demographic challenges and with resurgent interest rates in mind.

*Declining debt ratio still prudent*

To avoid undermining the objectives of the debt brake, various aspects should be considered when using reserves. First, it should only be possible to establish a reserve if the standard limit is met. This means, for example, that it should be impossible to accumulate reserves if the standard limit was exceeded owing to exceptional circumstances. Otherwise, debt could be higher over time than permitted by the standard limit. Moreover, the Basic Law explicitly makes provision for a control account. If central government were to regularly record the full margin below the standard limit as a reserve, the control account would conversely be transformed into a permanently available reserve. However, as central government is currently using a budget without net new borrowing as a benchmark, only a part of the margin below the ceiling is being transferred to reserves. This stabilises and effectively puts a brake on central government's debt level.<sup>38</sup>

*Accumulation of reserves given structurally balanced budget*

<sup>37</sup> Aside from this aspect, there are other differences between the national and European rules. Important examples are the definition of financial transactions and the cyclical adjustment methods used in each case. For more details, see Deutsche Bundesbank (2011), *op cit*, pp 28 ff.

<sup>38</sup> The objective of no net borrowing is not to avoid structural new borrowing; instead, an unadjusted figure is targeted. Thus, cyclical fluctuations are not taken into account. In this respect, the objective of no net borrowing appears less suited to ensuring a stable budgetary policy than a structurally balanced budget. Furthermore, there is the risk of conflict with the European rules.

*Rule-based use of reserves to cushion negative shocks*

One particularly important advantage of reserves is their potential to stabilise budgetary policy in the face of unpleasant surprises. However, this does not ultimately line up with planning a full depletion of existing reserves on a regular basis in the medium term. Instead, it would make sense to use them only as an insurance policy for unexpected structural budget shortfalls. To this end, directly after a surprise of this kind, greater use of the reserves could be made at first and then subsequently scaled back (ie the withdrawals should gradually decline over the years). Any consolidation that may become necessary to close the unexpected funding gap could thus be stretched out over time. The spending path would be stabilised or an abrupt tax hike avoided, as the reserves would have served as an additional stabiliser. Safety margins below the normal ceilings could therefore be smaller. With a rule-based restriction on the use of reserves, it would be possible to prevent this from fostering an erratic or unsound budgetary policy.

## Avoid structural problems through use of reserve funds

*Use of reserves for structural burdens should require decisions on counter-financing after depletion of reserves*

The budget should be structurally sound after the reserves are depleted, at the latest. This applies given their function as insurance against unexpected unpleasant surprises, as described above. However, it also applies, in particular, if reserves are to be used not just in response to surprises, but on a discretionary basis for any additional measures that burden the budget. This refers to central government's current approach of budgeting for the full use of the reserve to finance the budget. Thus, it would be least concerning if the budget were to be burdened with measures that largely have a temporary effect, such as major investment projects. Structural burdens that still exist even after the reserve is depleted should be offset by tax hikes or spending cuts already agreed in advance (global cuts in expenditure or increases in revenue do not achieve this). Central government's new reserve for demographic challenges highlights the difficulties that arise otherwise: it is

planned to use these funds in 2025 to compensate for extensive financial burdens. However, it is still unclear how the significant additional structural burden after 2025 expected as part of the pension benefits package is to be financed.

## Compliance with European rules

Finally, it must be ensured that the European fiscal rules are complied with. Given the significant surpluses and sound underlying conditions, there is currently no indication that the EU limits will be exceeded. However, the structural surpluses are likely to shrink in future.

*Compliance with EU rules currently assured*

The European rules are based on the general government structural deficit as defined in the national accounts, for which a standard limit of 0.5% of GDP applies. Under these rules, central government bears responsibility for the social security funds, and the state governments are responsible for their local authorities. In Germany, fiscal surveillance of general government's compliance with the European rules is the task of the Stability Council. Amongst other things, the Stability Council has to monitor whether there is a risk of the limit being exceeded even in the event of compliance with the relevant national rules. If this were the case, the Council would have to submit proposals to prevent such a breach of the rules. But to do this, it needs detailed information about central and state government's plans. Notably, this includes comprehensive disclosures about the planned use of reserves and off-budget entities by these levels of government. The documents presented to the Stability Council do not appear to be adequate in this respect, particularly in the case of the state governments. This has been pointed out, not least, by the independent Advisory Board.<sup>39</sup>

*Stability Council needs much better information*

<sup>39</sup> See Independent Advisory Board to the Stability Council, Ninth statement on compliance with the upper limit for the structural general government budget deficit pursuant to section 51 (2) of the Budgetary Principles Act (Haushaltsgrundsatzgesetz), June 2018, pp 17-18.

8 Less German MFIs' holdings of paper issued by euro-area MFIs. 9 Including national banknotes still in circulation. 10 The German contributions to the Eurosystem's monetary aggregates should on no account be interpreted as national monetary aggregates and are therefore not comparable with the erstwhile German

money stocks M1, M2 or M3. 11 The difference between the volume of euro banknotes actually issued by the Bundesbank and the amount disclosed in accordance with the accounting regime chosen by the Eurosystem (see also footnote 2 on banknote circulation in Table III.2).

of euro banknotes put into circulation by the Bundesbank in accordance with the accounting regime chosen by the Eurosystem (see also footnote 2 on banknote circulation in Table III.2). The volume of currency actually put into circulation by the

Bundesbank can be calculated by adding to this total the item "Intra-Eurosystem liability/claim related to banknote issue" (see "Other liability items"). <sup>5</sup> Excluding central governments' deposits. <sup>6</sup> In Germany, only savings deposits.

Discrepancies may arise from rounding. \* The banking system's liquidity position is defined as the current account holdings in euro of euro area credit institutions with the Eurosystem. Amounts are derived from the consolidated financial statement of the Eurosystem and the financial statement of the Bundesbank. 1 Figures are daily averages for the reserve maintenance period ending in the month indicated. Following the changeover in the frequency of Governing Council monetary policy meetings to a six-week cycle, a reserve maintenance period no longer ends in every month. No

figures are available in such cases. 2 Source: ECB. 3 Includes liquidity provided under the Eurosystem's asset purchase programmes. 4 From August 2009 includes liquidity absorbed as a result of the Eurosystem's foreign exchange swap operations. 5 From 2002 euro banknotes and other banknotes which have been issued by the national central banks of the Eurosystem and which are still in circulation. In accordance with the accounting procedure chosen by the Eurosystem for the issue of euro banknotes, a share of 8% of the total value of the euro banknotes in circulation is

II. Overall monetary survey in the euro area

allocated to the ECB on a monthly basis. The counterpart of this adjustment is shown under "Other factors". The remaining 92% of the value of the euro banknotes in circulation is allocated, likewise on a monthly basis, to the NCBs, with each NCB showing in its balance sheet the share of the euro banknotes issued corresponding to its paid-up share in the ECB's capital. The difference between the value of the euro banknotes allocated to an NCB and the value of the euro banknotes which that NCB has put into circulation is likewise shown under "Other

factors". From 2003 euro banknotes only. <sup>6</sup> Remaining items in the consolidated financial statement of the Eurosystem and the financial statement of the Bundesbank. <sup>7</sup> Equal to the difference between the sum of liquidity-providing factors and the sum of liquidity-absorbing factors. <sup>8</sup> Calculated as the sum of the "Deposit facility", "Banknotes in circulation" and "Credit institutions' current account balances".

\* The consolidated financial statement of the Eurosystem comprises the financial statement of the European Central Bank (ECB) and the financial statements of the national central banks of the euro area member states (NCBs). The balance sheet items for foreign currency, securities, gold and financial instruments are valued at

market rates at the end of the quarter. <sup>1</sup> According to the accounting regime chosen by the Eurosystem on the issue of euro banknotes, a share of 8% of the total value of the euro banknotes in circulation is allocated to the ECB on a monthly basis. The counterpart of this adjustment is disclosed as an "Intra-Eurosystem liability related to

III Consolidated financial statement of the Eurosystem

euro banknote issue". The remaining 92 % of the value of the euro banknote in circulation is also allocated to the NCBs on a monthly basis, and each NCB shows in its balance sheet the share of the euro banknotes issued which corresponds to its paid-up share in the ECB's capital. The difference between the value of the euro bank-

notes allocated to the NCB according to the aforementioned accounting regime and the value of euro banknotes put into circulation is also disclosed as an "Intra-Eurosystem claim/liability related to banknote issue". <sup>2</sup> For the Deutsche Bundesbank: including DM banknotes still in circulation. <sup>3</sup> Source: ECB.

\* Assets and liabilities of monetary financial institutions (MFIs) in Germany. The assets and liabilities of foreign branches, of money market funds (which are also classified as MFIs) and of the Bundesbank are not included. For the definitions of the respective items, see the footnotes to Table IV.3. <sup>1</sup> Owing to the Act Modernising Accounting Law (Gesetz zur Modernisierung des Bilanzrechts) of 25 May 2009, derivative financial instruments in the trading portfolio (trading portfolio derivatives) within the meaning of section 340e (3) sentence 1 of the German Commercial Code (Handels-

gesetzbuch) read in conjunction with section 35 (1) No 1a of the Credit Institution Accounting Regulation (Verordnung über die Rechnungslegung der Kreditinstitute) are classified under "Other assets and liabilities" as of the December 2010 reporting date. Trading portfolio derivatives are listed separately in the Statistical Supplement to the Monthly Report 1, Banking statistics, in Tables I.1 to I.3. <sup>2</sup> For building and loan associations: including deposits under savings and loan contracts (see Table IV.12). <sup>3</sup> Included in time deposits. <sup>4</sup> Excluding deposits under savings and loan

July	...	...	...	...	...
Aug	2,417,835	1,505	430,763	578,742	111,196

<sup>1</sup> The reserve maintenance period starts on the settlement day of the main refinancing operation immediately following the meeting of the Governing Council of the ECB for which the discussion on the monetary policy stance is scheduled.  
<sup>2</sup> Article 3 of the Regulation of the European Central Bank on the application of minimum reserves (excluding liabilities to which a reserve ratio of 0% applies, pursuant to Article 4 (1)). <sup>3</sup> Amount after applying the reserve ratio to the reserve base. The reserve ratio for liabilities with agreed maturities of up to two years was

2% between 1 January 1999 and 17 January 2012. Since 18 January 2012, it was stood at 1%. <sup>4</sup> Article 5 (2) of the Regulation of the European Central Bank on the application of minimum reserves. <sup>5</sup> Average credit balances of credit institutions at national central banks. <sup>6</sup> Average credit balances less required reserves after deduction of the lump-sum allowance. <sup>7</sup> Required reserves after deduction of the lump-sum allowance.

\* The interest rate statistics gathered on a harmonised basis in the euro area from January 2003 are collected in Germany on a sample basis. The MFI interest rate statistics are based on the interest rates applied by MFIs and the related volumes of euro-denominated deposits and loans to households and non-financial corporations domiciled in the euro area. The household sector comprises individuals (including sole proprietors) and non-profit institutions serving households. Non-financial corporations include all enterprises other than insurance corporations, banks and other financial institutions. The most recent figures are in all cases to be regarded as provisional. Subsequent revisions appearing in the following Monthly Report are not specially marked. Further information on the MFI interest rate statistics can be found on the Bundesbank's website (Statistics/Money and capital markets/Interest rates and yields/Interest rates on deposits and loans). <sup>o</sup> The statistics on outstanding amounts are collected at the end of the month. <sup>1</sup> The effective interest rates are calculated

either as annualised agreed interest rates or as narrowly defined effective rates. Both calculation methods cover all interest payments on deposits and loans but not any other related charges which may occur for enquiries, administration, preparation of the documents, guarantees and credit insurance. <sup>2</sup> Data based on monthly balance sheet statistics. <sup>3</sup> Secured and unsecured loans for home purchase, including building and home improvements; including loans granted by building and loan associations and interim credits as well as transmitted loans granted by the reporting agents in their own name and for their own account. <sup>4</sup> Loans for consumption are defined as loans granted for the purpose of personal use in the consumption of goods and services. <sup>5</sup> For the purpose of these statistics, other loans are loans granted for other purposes such as business, debt consolidation, education, etc. <sup>6</sup> Including overdrafts (see also footnotes 12 to 14 on p. 47\*).

For footnotes \* and 1 to 6, see p. 44•. + For deposits with an agreed maturity and all loans excluding revolving loans and overdrafts, credit card debt: new business covers all new agreements between households or non-financial corporations and the bank. The interest rates are calculated as volume-weighted average rates of all new agreements concluded during the reporting month. For overnight deposits, deposits redeemable at notice, revolving loans and overdrafts, credit card debt: new business is collected in the same way as outstanding amounts for the sake of simplicity. This

means that all outstanding deposit and lending business at the end of the month has to be incorporated in the calculation of average rates of interest. <sup>7</sup> Estimated. The volume of new business is extrapolated to form the underlying total using a grossing-up procedure. <sup>8</sup> Including non-financial corporations' deposits; including fidelity and growth premiums. <sup>9</sup> Excluding overdrafts. <sup>10</sup> Annual percentage rate of charge, which contains other related charges which may occur for enquiries, administration, preparation of the documents, guarantees and credit insurance.

For footnotes \* and 1 to 6, see p 44\*. For footnotes + and 7 to 10, see p 45\*. **11** For the purposes of the interest rate statistics, a loan is considered to be secured if collateral (amongst others financial collateral, real estate collateral, debt securities) in at least the same value as the loan amount has been posted, pledged or assigned. **12** Including revolving loans which have all the following features: (a) the borrower may use or withdraw the funds to a pre-approved credit limit without giving prior notice to the lender; (b) the amount of available credit can increase and decrease as funds are borrowed and repaid; (c) the loan may be used repeatedly;

(d) there is no obligation of regular repayment of funds. **13** Overdrafts are defined as debit balances on current accounts. They include all bank overdrafts regardless of whether they are within or beyond the limits agreed between customers and the bank. **14** Including convenience and extended credit card debt. Convenience credit is defined as the credit granted at an interest rate of 0% in the period between payment transactions effected with the card during one billing cycle and the date at which the debit balances from this specific billing cycle become due. **15** The amount category refers to the single loan transaction considered as new business.

<sup>1</sup> Data as of 2016 Q3 are based on Solvency II supervisory data, valuation of listed securities at the corresponding consistent price from the ESCB's securities database. Figures from 2016 Q3 on have been revised. Up to and including 2016 Q2 data are based on Solvency I supervisory data from the Federal Financial Supervisory Authority (BaFin), supplemented by estimates and own calculations. <sup>2</sup> Accounts receivable to monetary financial institutions, including registered bonds, borrowers' note loans and registered Pfandbriefe. <sup>3</sup> Including deposits retained on assumed reinsurance as

well as registered bonds, borrowers' note loans and registered Pfandbriefe. <sup>4</sup> Not including the reinsurance business conducted by primary insurers, which is included there. <sup>5</sup> The term "pension funds" refers to the institutional sector "pension funds" of the European System of Accounts. Pension funds thus comprise company pension schemes and occupational pension schemes for the self-employed. Social security funds are not included.

<sup>1</sup> Data as of 2016 Q3 are based on Solvency II supervisory data. Figures from 2016 Q3 on have been revised. Up to and including 2016 Q2 data are based on Solvency I supervisory data from the Federal Financial Supervisory Authority (BaFin), supplemented by estimates and own calculations. <sup>2</sup> Including deposits retained on ceded business as well as registered bonds, borrowers' note loans and registered Pfandbriefe. <sup>3</sup> As of 2016 Q3 insurance technical reserves "life" pursuant to Solvency II taking account of transitional measures. Up to and including 2016 Q2: Long-term net equity of households in life insurance (including ageing provisions of health insurance schemes and premium reserves of accident insurance schemes with guaranteed premi-

um refund) and pension fund reserves pursuant to ESA 1995. <sup>4</sup> As of 2016 Q3 insurance technical reserves "non-life" pursuant to Solvency II. Up to and including 2016 Q2 unearned premiums and reserves for outstanding claims pursuant to ESA 1995. <sup>5</sup> Not including the reinsurance business conducted by primary insurers, which is included there. <sup>6</sup> The term "pension funds" refers to the institutional sector "pension funds" of the European System of Accounts. Pension funds thus comprise company pension schemes and occupational pension schemes for the self-employed. Social security funds are not included. <sup>7</sup> Own funds correspond to the sum of net worth and the liability item "Shares and other equity".

<sup>1</sup> Bearer debt securities with maximum maturities according to the terms of issue of over 4 years if their mean residual maturities exceed 3 years. Convertible debt securities, etc. debt securities with unscheduled redemption, zero-coupon bonds, floating-rate notes and bonds not denominated in euro are not included. Group yields for the various categories of securities are weighted by the amounts outstan-

ding of the debt securities included in the calculation. Monthly figures are calculated on the basis of the yields on all the business days in a month. The annual figures are the unweighted means of the monthly figures. <sup>2</sup> End of year or month. <sup>3</sup> Source: Deutsche Börse AG. <sup>4</sup> Only debt securities eligible as underlying instruments for futures contracts; calculated as unweighted averages.

Source: Bundesbank calculations based on Federal Statistical Office data. <sup>1</sup> Annual figures based on the calculations of the Federal Statistical Office. Bundesbank supplementary estimations for the reporting years after 2011 that are not yet available. The quarterly figures contain numerous off-budget entities which are assigned to the general government sector as defined in the national accounts but are not yet included in the annual calculations. From 2012, also including the bad bank FMSW. <sup>2</sup> The annual figures do not tally with the sum of the quarterly figures, as the

latter are all provisional. The quarterly figures for some insurance sectors are estimated. <sup>3</sup> The development of the types of expenditure recorded here is influenced in part by statistical changeovers. <sup>4</sup> Including discrepancies in clearing transactions between central, state and local government. <sup>5</sup> On the revenue side, this contains proceeds booked as disposals of equity interests and as loan repayments. On the expenditure side, this contains the acquisition of equity interests and loans granted. <sup>6</sup> Including central government liquidity assistance to the Federal Employment Agency.

Source: Federal Ministry of Finance and Bundesbank calculations. **1** This total, unlike that in Table X. 5, does not include the receipts from the equalisation of burdens levies, local business tax (less local business tax transfers to central and state government), real property taxes and other local government taxes, or the balance of untransferred tax shares. **2** Respective percentage share of central, state and local government in revenue: wage tax and assessed income tax 42.5:42.5:15, corporation tax and non-assessed taxes on earnings 50:50:-, final withholding tax on interest income and capital gains, non-assessed taxes on earnings 44:44:12. **3** After

deducting child benefit and subsidies for supplementary private pension plans. **4** Final withholding tax on interest income and capital gains, non-assessed taxes on earnings. **5** The allocation of revenue to central, state and local government, which is adjusted at more regular intervals, is regulated in section 1 of the Revenue Adjustment Act. Respective percentage share of central, state and local government in revenue for 2017: 50.7:46.6:2.7. The EU share is deducted from central government's share. **6** Respective percentage share of central and state government for 2017: 22.6:77.4. **7** For the breakdown, see Table X. 7.

Sources: Federal Statistical Office; Federal Employment Agency. \* Annual and quarterly figures: averages; calculated by the Bundesbank; deviations from the official figures are due to rounding. 1 Workplace concept; averages. 2 Monthly figures: end of month. 3 Number within a given month. 4 Mid-month level. 5 Relative to the total civilian labour force. 6 Excluding government-assisted forms of employment and seasonal jobs, including jobs located abroad. 7 From January 2017, persons receiving additional income assistance (unemployment benefit and unemployment benefit II at the same time) shall be assigned to the legal category of the Third Book

of the Social Security Code (SGB III). 8 Unadjusted figures estimated by the Federal Employment Agency. In 2016 and 2017, the estimated values for Germany deviated from the final data by a maximum of 1.1 % for employees subject to social contributions, by a maximum of 0.4 % for persons solely in jobs exempt from social contributions, and by a maximum of 70.0 % for cyclically induced short-time work. 9 Initial preliminary estimate by the Federal Statistical Office. 10 From May 2018 calculated on the basis of new labour force figures.

## XI Economic conditions in Germany

### 7 Prices

Harmonised Index of Consumer Prices							Memo item: Consumer price index (national concept)	Con- struction price index	Index of producer prices of industrial products sold on the domestic market <sup>5</sup>	Index of producer prices of agricultural products <sup>5</sup>	Indices of foreign trade prices		HWWI Index of World Market Prices of Raw Materials <sup>6</sup>	
Total	of which <sup>1</sup>				of which Housing rents <sup>4</sup>	Exports					Imports	Energy <sup>7</sup>	Other raw materials <sup>8</sup>	
	Food <sup>2</sup>	Non- energy industrial goods	Energy <sup>3</sup>	Services

\* Non-financial groups admitted to the Prime Standard segment of the Frankfurt Stock Exchange which publish IFRS consolidated financial statements on a quarterly or half-yearly basis and make a noteworthy contribution to value added in Germany. Excluding groups engaged in real estate activities. 1 Earnings before interest, taxes, depreciation and amortisation. 2 Quantile data are based on the groups' unweighted

return on sales. 3 Annual figures do not always match the sum of the two half-year figures. See Quality report on consolidated financial statement statistics, p 3. 4 Adjusted for substantial changes in the basis of consolidation of large groups and in the reporting sample. See the explanatory notes in the Statistical Supplement Seasonally adjusted business statistics. 5 Including groups in agriculture and forestry.

1 Excluding freight and insurance costs of foreign trade. 2 For example, warehouse transactions for the account of residents, deductions of goods returned and deductions of exports and imports in connection with goods for processing. 3 Including freight and insurance costs of foreign trade. 4 Including net

acquisition/disposal of non-produced non-financial assets. 5 Statistical errors and omissions, resulting from the difference between the balance on the financial account and the balances on the current account and the capital account.

XII External sector

3 Foreign trade (special trade) of the Federal Republic of Germany,  
by country and group of countries \*

€ million

° Assets and liabilities vis-à-vis all countries within and outside the euro area. Up to December 2000, the levels at the end of each quarter are shown, owing to revaluations, at market prices; within each quarter, however, the levels are computed on the basis of cumulative transaction values. From January 2001, all end-of-month levels are valued at market prices. 1 Mainly net claims on TARGET2 balances (according to

the respective country designation), since November 2000 also balances with non-euro area central banks within the ESCB. 2 Mainly long-term debt securities from issuers within the euro area. 3 Including estimates of currency in circulation abroad. 4 See Deutsche Bundesbank, Monthly Report, October 2014, p 22. 5 Euro opening balance sheet of the Bundesbank as at 1 January 1999.

## XII External sector

### 9 Assets and liabilities of enterprises in Germany (other than banks) vis-à-vis non-residents \*

€ million

\* The effective exchange rate corresponds to the weighted external value of the currency concerned. The method of calculating the indicators of the German economy's price competitiveness is consistent with the procedure used by the ECB to compute the effective exchange rates of the euro (see Monthly Report, November 2001, pp 50-53, May 2007, pp 31-35 and August 2017, pp 41-43). For more detailed information on methodology see the ECB's Occasional Paper No 134 (www.ecb.eu). A decline in the figures implies an increase in competitiveness. 1 ECB calculations are based on the weighted averages of the changes in the bilateral exchange rates of the euro vis-à-vis the currencies of the following countries: Australia, Bulgaria, Canada, China, Croatia, Czechia, Denmark, Hong Kong, Hungary, Japan, Norway, Poland, Romania, Singapore, South Korea, Sweden, Switzerland, the United Kingdom and the United States. Where current price and wage indices were not avail-

able, estimates were used. 2 ECB calculations. Includes countries belonging to the group EER-19 (see footnote 1) and additionally Algeria, Argentina, Brazil, Chile, Iceland, India, Indonesia, Israel, Malaysia, Mexico, Morocco, New Zealand, Philippines, Russian Federation, South Africa, Taiwan, Thailand, Turkey and Venezuela. 3 Annual and quarterly averages. 4 Euro area countries (from 2001 including Greece, from 2007 including Slovenia, from 2008 including Cyprus and Malta, from 2009 including Slovakia, from 2011 including Estonia, from 2014 including Latvia, from 2015 including Lithuania) as well as Canada, Denmark, Japan, Norway, Sweden, Switzerland, the United Kingdom and the United States. 5 Euro area countries (see footnote 4) and countries belonging to the group EER-19. 6 Euro area countries and countries belonging to the group EER-38 (see footnote 2).

## Overview of publications by the Deutsche Bundesbank

This overview provides information about selected recent economic and statistical publications by the Deutsche Bundesbank. Unless otherwise indicated, these publications are available in both English and German, in printed form and on the Bundesbank's website.

The publications are available free of charge from the External Communication Division. Up-to-date figures for some statistical datasets are also available on the Bundesbank's website.

### ■ Annual Report

### ■ Financial Stability Review

### ■ Monthly Report

For information on the articles published between 2000 and 2017 see the index attached to the January 2018 Monthly Report.

### Monthly Report articles

#### October 2017

- Global liquidity, foreign exchange reserves and exchange rates of emerging market economies
- The natural rate of interest
- The supervisory review and evaluation process for smaller institutions and proportionality considerations
- The Eurosystem's new money market statistical reporting – initial results for Germany
- The new ESCB insurance statistics – integrated reporting flow and initial results

#### November 2017

- The current economic situation in Germany

#### December 2017

- Outlook for the German economy – macro-economic projections for 2018 and 2019 and an outlook for 2020
- German enterprises' profitability and financing in 2016
- Mark-ups of firms in selected European countries
- The Eurosystem's financial market infrastructure – origin and future set-up

#### January 2018

- The impact of the internationalisation of German firms on domestic investment
- The importance of bank profitability and bank capital for monetary policy
- Developments in corporate financing in the euro area since the financial and economic crisis
- Finalising Basel III

#### February 2018

- The current economic situation in Germany

#### March 2018

- German balance of payments in 2017
- The demand for euro banknotes at the Bundesbank
- Contingent convertible bonds: design, regulation, usefulness

#### April 2018

- Wage growth in Germany: assessment and determinants of recent developments
- Germany's external position: new statistical approaches and results since the financial crisis
- Current regulatory developments in the field of payments and in the settlement of securities and derivatives
- Maastricht debt: methodological principles, compilation and development in Germany

#### May 2018

- The current economic situation in Germany

#### June 2018

- Outlook for the German economy – macro-economic projections for 2018 and 2019 and an outlook for 2020
- Lower bound, inflation target and the anchoring of inflation expectations

#### July 2018

- The market for Federal securities: holder structure and the main drivers of yield movements
- The realignment of the Chinese economy and its global implications
- Trends in the financing structures of German non-financial corporations as reflected in the corporate financial statements statistics

#### August 2018

- The current economic situation in Germany

## Statistical Supplements to the Monthly Report

- 1 Banking statistics<sup>1, 2</sup>
- 2 Capital market statistics<sup>1, 2</sup>
- 3 Balance of payments statistics<sup>1, 2</sup>
- 4 Seasonally adjusted business statistics<sup>1, 2</sup>
- 5 Exchange rate statistics<sup>2</sup>
