Overview

Two-speed German economy continues

Global economic growth still moderate The global economy likely expanded in the third quarter of 2019 at a similar rate to the second quarter. This means that the upturn in economic activity predicted in a number of forecasts has not yet materialised. Of the major economies, the third quarter in the United States was once again characterised by robust aggregate output growth, and the UK economy recovered from its second-quarter setback. The euro area saw another period of muted economic growth. In China, the gradual moderation of growth continued, and in other large emerging markets economic activity remained mostly subdued.

Protracted sluggishness in industry, with risk of spillover to services sector The ongoing moderate growth in the global economy was chiefly attributable to the sluggishness in global industry, which has barely expanded its output since the first quarter of 2019. The underlying trend of global trade likewise remained weak despite a marginal rebound in July and August. Although the global purchasing managers' index for the manufacturing sector has picked up again somewhat in recent months, it has not reached the expansion threshold. At the same time, there have been growing signs that this slowdown in industrial activity is spreading to the services sector. Throughout the reporting period, the trade dispute between the United States and China has been detrimental to global economic activity. Should the two countries reach an initial agreement soon, this could boost businesses' confidence again.

Political risks and accommodative monetary policy influencing financial markets The international financial markets have been characterised in the third and fourth quarters by shifting assessments of the political risks and the accommodative monetary policy decisions made by central banks on both sides of the Atlantic. Yields on government bonds – amid fluctuations – largely fell overall as a result. This

decline was quite considerable in the United States, where the Federal Reserve lowered the interest rate corridor by a total of 0.75 percentage point in three stages during the reporting period. Yields on ten-year Federal bonds (Bunds) also dropped sharply for a time, reaching temporary historically low levels before recovering again. The interest rate spreads between tenyear bonds of other euro area countries and same-maturity Bunds narrowed in some cases, especially where Italian and Greek government bonds were concerned. The high demand for fixed-income securities also benefited European corporate bonds, net yields on which had fallen sharply. In the international equity markets, lower yields and investors' increased appetite for risk – coupled with diminishing volatility - pushed prices up considerably. After analysts had scaled back the profit expectations for the reporting period, most US corporations, in particular, surprisingly generated betterthan-expected profits for the third quarter. In the foreign exchange markets, the euro has slipped slightly since the end of June on a weighted average against the currencies of 19 major trading partners. Above-average depreciation against the US dollar, the yen and the pound sterling were counteracted by gains against some European currencies.

The Governing Council of the ECB adopted a comprehensive package of easing measures at the monetary policy meeting in September. It lowered the deposit facility rate by 10 basis points to -0.5% and adjusted its forward guidance on key interest rates. The Governing Council of the ECB now expects the key interest rates to remain at their present or lower levels until it has seen the inflation outlook clearly converge to a level sufficiently close to, but below, 2% within its projection horizon, and such convergence has been consistently reflected in core inflation dynamics.

Monetary policy: reduction in deposit facility rate and adjustment to forward quidance, ...

... resumption of net purchases under APP, ...

Moreover, the Governing Council decided to restart net purchases under its expanded asset purchase programme (APP) at a monthly pace of €20 billion as from 1 November 2019. It expects these net purchases to run for as long as necessary to reinforce the accommodative impact of its policy rates, and to end shortly before it starts raising the key ECB interest rates.

utable to the persistent weakness in the exportoriented industrial sector. Meanwhile, domestically oriented sectors continued to provide some impetus, having been bolstered by the ongoing favourable income outlook for employees. Although the cyclical slowdown gradually became noticeable in the labour market, it remained fairly robust.

... measures to support bank-based transmission

To provide further support for its accommodative monetary policy stance, the Governing Council of the ECB adjusted the modalities of the third series of targeted longer-term refinancing operations (TLTRO III). It extended the maturity of the individual operations and shelved the previously planned interest rate premium of 10 basis points. In order to provide additional support for the bank-based transmission of monetary policy, the Governing Council decided to introduce a two-tier system for reserve remuneration. This means that, as of 30 October 2019, part of banks' holdings of excess liquidity on current accounts with the Eurosystem will be exempt from the negative deposit facility rate and remunerated at 0%.

Robust underlying monetary dynamics The broad monetary aggregate M3 registered strong inflows in the third quarter, continuing its robust growth. Lending to the domestic private sector and inflows of funds from abroad remained the main growth drivers. While the expansion of loans to households continued on its upward trajectory, growth in lending to nonfinancial corporations was dampened somewhat by the persistent economic slowdown in the euro area. According to the latest bank lending survey, banks' lending policies remained largely unchanged on balance in both corporate and retail banking during the reporting quarter.

Economic activity in Germany rose slightly in O3 2019 German economic output was up slightly in the third quarter of 2019. According to the Federal Statistical Office's flash estimate, real gross domestic product (GDP) increased by 0.1% on the previous quarter after seasonal and calendar adjustment. The underlying cyclical trend remained muted. This was again mainly attrib-

In terms of the individual economic sectors, German economic activity continued to expand at two different speeds in the third quarter. Declining manufacturing activity was the main reason for a lack of GDP growth. Construction output is likely to have risen, however. Value added in business-related services sectors (excluding trade) also probably exceeded the level of the previous quarter somewhat. Trade provided a clear positive stimulus. This was not just down to flourishing retail trade; turnover in wholesale trade also saw a distinct rise despite the sluggishness of industry. On the demand side, higher private and government consumption expenditure, in particular, boosted overall economic output. Exports likewise rose markedly again compared with the weak preceding quarter. This is noteworthy because export activity and industrial output usually track each other fairly closely. By contrast, private investment in machinery and equipment is unlikely to have changed much. The degree of overall capacity utilisation decreased further and drew closer to the normal capacity utilisation range.

These two speeds of economic activity can also be seen in credit developments. While banks in Germany expanded their lending to the domestic private sector distinctly again in the reporting quarter – albeit to a lesser extent than in the first half of the year – growth was primarily driven by loans to households, especially loans for house purchase. Loans to non-financial corporations increased only slightly in the reporting quarter, however. First, a countermovement to the strong growth was apparent in the third quarter; second, subdued investment activity set in. Demand for loans to enterprises and housing loans was propped up by the pro-

activity still split

Economic

German banks' lending to domestic private sector lively again longed downward trend in lending rates, notably for longer lock-in periods. Lending policies remained virtually unchanged on balance across all segments. Nevertheless, margins, especially on riskier loans, were expanded significantly in some cases. Statistical effect temporarily dampens consumer price inflation in third quarter

Impact of downturn on labour market limited so far The considerable economic downturn is gradually affecting the labour market. Nonetheless, the labour market still appeared fairly robust in the third quarter. Employment continued to rise, albeit at a considerably slower pace in comparison with last year. Unemployment did not fall any further, but stagnated at a level that was exceptionally low by historical standards. There was a slight increase in short-time work for economic reasons. However, the labour market outlook for the next few months has deteriorated further.

Sharp rise in negotiated pay rates on account of one-off effects The third quarter saw an exceptionally strong increase in negotiated pay rates. Including additional benefits, these rates rose year-on-year by 4.2% in the third quarter of 2019, compared with 2.1% in 2018. This temporary, considerably higher growth rate was mainly due to new special payments in the metal-working and electrical engineering industries, which had been agreed last year and were first due in July 2019. The increase in negotiated rates of basic pay - into which these special payments do not flow – was less significant. As in the previous quarter, the main drivers here were the services sectors. The weaker growth in the negotiated rates of basic pay in the production sector including construction was primarily due to a several-month freeze at the old pay rates from the previous year's collective wage agreements. One factor at play here was that regular increases in the negotiated rates of basic pay had been substituted by special payments in some cases. By contrast, the economic downturn in industry was not yet particularly evident. The wage demands for the outstanding negotiations in this year's wage round are mostly higher than those of the last wage round for the same sectors.

Consumer prices picked up moderately in the third quarter of the year. The Harmonised Index of Consumer Prices (HICP) rose by 0.3% in seasonally adjusted terms. In particular, this had a dampening effect on prices for energy, owing to distinctly lower crude oil prices. By contrast, food prices increased substantially and thus continued their upward movement, which has been persisting for some time now. Services also continued to become more expensive, albeit only slightly. The travel market – a market in which prices often fluctuate heavily - was a source of dampening impulses here. The cost of air travel increased by roughly the same amount as the package holiday prices decreased. Given that package holidays account for a larger share in the basket of goods, their decline had a greater effect. The prices of industrial goods excluding energy saw a slight increase, in line with the development of the corresponding producer and import prices. Despite this, annual headline HICP inflation declined significantly overall, from 1.7% to 1.1%. This was also the case for the rate excluding energy and food, which fell from 1.5% to 0.9%. Above all, this was driven by a statistical effect in prices for package holidays, which is likely to have reduced the headline rate in the third quarter of 2019 by 0.4 percentage point and core inflation by as much as 0.6 percentage point. Seasonally adjusted consumer prices were unchanged in October on the month. Overall, inflation remained at 0.9% in year-onyear terms. Leaving aside not only energy and food but also the equally volatile price components, travel services and clothing, the rate of inflation, at 1.5%, still stood at a higher level.

The slowdown of the German economy will probably continue in the fourth quarter of 2019. However, it is not likely to intensify markedly. As things currently stand, overall economic output could more or less stagnate. Thus, the economy would largely tread water again in the second half of this year as a whole. However, from today's vantage point, there is no reason to fear that Germany will slide into

German economy could stagnate by the end of the year

recession. On the contrary, leading economic indicators for industry are showing the first tentative signs that the downward trend in this economic sector could decelerate. According to the ifo Institute, business expectations in the manufacturing sector recently brightened somewhat. Industrial enterprises' order situation deteriorated only slightly in the third quarter. The underlying trend of incoming orders has remained the same for some months, albeit at a low level. The exportoriented industry could therefore stabilise before the more domestically-oriented sectors are affected more strongly. The domestic economy will probably continue to provide momentum. Capacity utilisation in the booming construction sector remains high, and no substantial growth in output is to be expected here. However, because the labour market is likely to remain fairly robust and wages are expected to grow considerably, households' income prospects should remain favourable. It is therefore to be assumed that private consumer demand will support economic activity in the current quarter, too. This also applies in general to the expansionary fiscal policy stance.

Government budget surplus still significant this year, but shrinking Public finances remain in very good shape. The general government surplus stood at 1.9% of GDP in 2018. It is likely to decline this year, yet still remain significant. Above all, spending policy is being relaxed and pensions and investment, for instance, are seeing dynamic growth. The economic slowdown is causing the rise in tax revenue, in particular, to decelerate slightly compared with the previous years. Overall, however, the cyclical component is moderate given the robust domestic economy.

Surplus to continue shrinking over next two years

It is foreseeable that the surplus will continue to shrink considerably in the coming two years. For example, fiscal policy is set to be loosened further. More funds are to be made available for infrastructure and education, and there are indications of continued high growth in social spending. Furthermore, the solidarity surcharge is being partially abolished in 2021. The new climate action programme will put a slight burden on the government budget on balance.

The Federal budget is expected to record a surplus again this year. In contrast to the original plans, it will not be necessary to tap the refugee reserve to avoid net borrowing. In fact, the reserve could see a further marked increase. The budget plans for 2020 also appear to have been drawn up with caution, on the whole.

Federal budget once again records significantly better result than planned

The structural surpluses of central and general government are likely to decline significantly. However, the national and European fiscal rules still make for financial leeway which could be used to improve the conditions for growth and employment. As a result, the solidarity surcharge could be reduced as early as in the coming year. It still appears appropriate to completely abolish this surcharge in the foreseeable future and, if necessary, to combine this step with a fundamental tax reform. State and local governments could reinforce their efforts to improve education and infrastructure.

Measures conducive to growth and employment could be accelerated

By contrast, a special package of measures to stimulate the economy does not seem necessary at present. Most recent forecasts show the current and future economic situation more or less within the normal range. In this context, public finances are already stabilising economic growth appreciably. The considerable risks to the economic outlook, primarily resulting from the external environment, are nonetheless to be borne in mind. Should economic activity slump and aggregate capacity become substantially underutilised, fiscal policymakers would also be called upon to take steps to spur the economy. The fact that German public finances are sound would then facilitate a sizeable contribution to stability.

Public finances are supporting economic activity; currently no need for economic stimulus packages

Global and European setting

Global economic developments

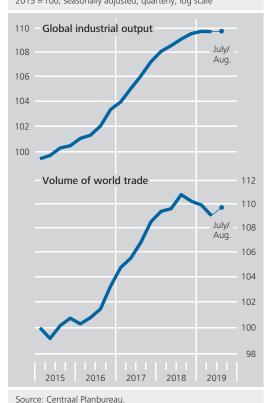

Global economic growth remains moderate

The global economy likely expanded in the third guarter of 2019 at a similar rate to the second quarter. This means that the upturn in economic activity predicted in a number of forecasts has not yet materialised. Of the major economies, the United States was once again characterised by robust aggregate output growth in the third quarter, while the UK economy recovered from its second-quarter setback. In the euro area, economic growth was muted once again, and growth in Japan came to a virtual standstill. In China, the gradual moderation of growth continued, and in other large emerging markets economic activity remained mostly subdued.

The ongoing moderate growth in the global economy was chiefly attributable to the sluggishness in global industry, which has barely expanded its production since the first quarter of 2019. Although the global purchasing managers' index for the manufacturing sector has picked up again somewhat in recent months, it has not reached the expansion threshold. At the same time, there have been increasing indications that the slowdown in industry is spreading to the services sector (see the box on pp. 11-12). One aspect that was weighing on global economic activity until recently was the trade conflict between the United States and China. In the past few weeks, however, there have been some signs of easing tensions.1 According to the underlying trend, global trade remained listless until recently, despite a slight recovery in July and August.

Protracted sluggishness in industry, with risk of spillover to services sector

tries had been reached with regard to an agreement that would, above all, boost Chinese purchases of US agricultural products. The agreement, which has not yet been signed, is intended to pave the way for a more comprehensive trade agreement that will cover other contentious

2 See International Monetary Fund (2019).

In light of these developments, the latest projections from the International Monetary Fund (IMF) could have been somewhat too optimistic. Although the IMF staff revised its growth projections for 2019 and 2020 markedly downwards once again,² it held on to its expectation that global economic activity would pick up in the second half of 2019. In particular, the stabilisation of the difficult overall economic situation in some emerging market economies is expected to lift the growth rate of the global economy (based on purchasing power parity weightings) from 3.0% this year to 3.4% next year. Moreover, the expected recovery in global economic activity will depend on the impact of the supporting economic policy measures - primarily the accommodative monetary policy in

IMF revises projections for global growth downwards once again, but anticipates a certain upturn

¹ In mid-October, US President Donald Trump announced that a fundamental understanding between the two coun-

The two-speed global economy

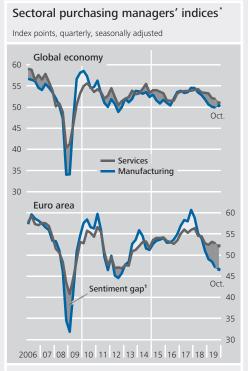

The global economic expansion, which had previously been vibrant, has distinctly lost steam over the past year and a half. The deceleration has been particularly pronounced in the manufacturing sector, where production growth has recently come to a virtual standstill.¹ In other sectors, however, gross value added seems to have continued to expand at comparatively constant rates.2 This "two-speed" global economic growth is also reflected in the results of business surveys. Whereas the global purchasing managers' index (PMI) for manufacturing has dropped considerably since the turn of 2017-18 and has even temporarily shown a contraction in production, its services counterpart has remained quite solidly above the expansion threshold. On balance, a sizeable gap has opened up between the two indicators.3 In the euro area, where the situation in manufacturing had been assessed particularly favourably in 2017, the indicator fell even more significantly. This led to a rather sizeable sentiment gap, which had last been observed in the aftermath of the global financial and economic crisis.

The diverging developments in the manufacturing and services sectors are likely to reflect a change in the composition of global demand, with investment dynamics

slowing down distinctly in the past few quarters. The volume of global trade has even been trending downwards for nearly a year now. This has particularly affected the manufacturing sector, which is exportoriented and geared towards the production of capital goods.⁴ By contrast, many branches of the services sector are more frequently used by households. Accordingly, this sector has benefited more from the relatively robust consumption activity.

For the economic outlook, the degree of vulnerability of the services sector to potential contagion from the flagging industrial sector plays a major role. For instance, in the latest edition of its World Economic Outlook, the IMF points to spillover effects from manufacturing as a key downside risk to the world economy.⁵ Based on past experience, this concern appears to be justi-

1 According to data provided by the Dutch economic research institute Centraal Planbureau, global industrial production was up by merely 0.4% on the year in August 2019. This contrasts with a figure of more than 4% at the beginning of 2018.

Sources: J. P. Morgan, IHS Markit and Bundesbank calculations. * Sub-index for production. 1 Dark shading indicates worse and light shading indicates better survey results for the manufacturing sector.

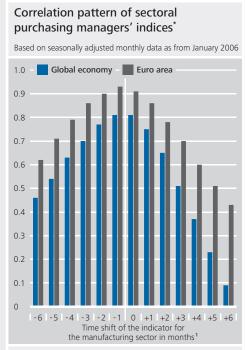

Deutsche Bundesbank

² In the euro area, for instance, gross value added in manufacturing was down in the second quarter of 2019 by 1.1% on the year. Most other sectors saw growth rates ranging from 1% to 5%.

³ Among those countries that publish comparable PMIs, only in Brazil and India was production growth in manufacturing assessed more favourably than that in services in the third quarter of 2019.

⁴ According to OECD estimates, some 40% of manufacturing output in the G7 economies is produced to meet domestic investment demand and for exports. The corresponding share of services output is not even half this amount. See OECD (2019).

⁵ See International Monetary Fund (2019).

Sources: J. P. Morgan, IHS Markit and Bundesbank calculations.* Correlation between the contemporaneous production component of the indicator for services and the time-shifted counterpart for manufacturing. 1 Negative (positive) axis values correspond to a lead (lag) of the indicator for manufactur-

Deutsche Bundesbank

fied. Historically, there has been strong comovement between the sectoral PMIs over time, both globally and in the euro area. Substantial differences regarding the assessment of production trends have appeared on numerous occasions. However, they have rarely been long-lasting. Turnarounds in manufacturing have often preceded similar changes in sentiment in the services sector. This dynamic correlation pattern has also shown up in phases similar to the current situation. Both in the period from the fourth quarter of 2011 to the first quarter of 2012 as well as in the second and third quarters of 2015, purchasing managers' sentiment in global manufacturing was subdued, whereas the survey results for services held up better. In both cases, the subsequent closing of the sentiment gap was initially triggered by a deteriorating assessment of services, after which the macroeconomic situation ultimately improved.

There are, in fact, currently signs that the slump in industry is spilling over to services, especially into those sectors which are closely interlinked with manufacturing through value-added chains. Over the course of the past year, sentiment was already dipping markedly among firms specialised in supplying business-related services.6 In the euro area, the production indicators for this segment are already hinting at a slowing expansion.

Going forward, indirect transmission channels could also take on greater importance, with employment growth, in particular in the industrial sector, slowing in many places over the past few quarters. Survey-based indicators are pointing to a further decline, which is spilling over to other sectors.7 Should the labour market situation actually deteriorate, this will likely also impair the outlook for growth among consumptionrelated service providers.

These contagion effects could be amplified if industrial activity fails to regain traction soon or even takes a turn for the worse. Against this backdrop, it is a positive sign that the global PMI for manufacturing has undergone a slight recovery in the past few months and its counterpart for the euro area has at least stabilised.8 Consistent with these assessments, the Bundesbank's leading indicator for the global economy is showing that industrial activity may possibly have bottomed out. However, there are no signs yet of major improvement.

⁶ This is reflected, inter alia, in a gloomier assessment of production growth. By contrast, the corresponding survey results for consumption-related services and the financial sector saw little decline.

⁷ For instance, since as long ago as May 2019, the employment component of the global PMI for manufacturing has remained stuck below the expansion threshold of 50 points. At last report, the PMI for the services sector was just slightly above this mark.

⁸ This development, however, has been accompanied by a further deterioration in sentiment in the services sector, meaning that the global gap between the sector indicators was nearly entirely closed in October.

many countries – not being jeopardised by the emergence of risks such as a further escalation of trade disputes.

Commodity prices largely moving sideways

Against the background of persistently moderate global economic activity, crude oil prices trended sideways over the course of the reporting period. Although crude oil prices jumped by 15% in the aftermath of production losses in Saudi Arabia resulting from an attack in September, they promptly reverted to their previous level as production in Saudi Arabia normalised faster than anticipated. In addition, large global oil stocks had a stabilising effect and are indeed likely to have been able to offset the supply deficit for some time. This applies even more given the International Energy Agency's expectation that the crude oil market will have a tendency to be oversupplied next year.³ As this report went to press, the spot price for a barrel of Brent crude oil was, at US\$63, only marginally higher than in August. Futures were still trading at marked discounts across the entire range of maturities. According to the HWWI index, prices for non-energy commodities were likewise essentially unchanged from the levels they had reached in mid-August.

Rising core inflation in industrial

Energy prices caused price inflation in industrial countries to decrease markedly over the past few months to a fairly subdued level of 1.3% on the year in September. By contrast, the core rate excluding energy and food rose slightly over the same period to no less than 1.8%.

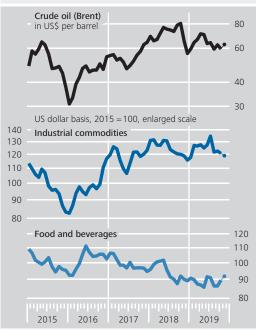

Selected emerging market economies

Chinese growth gradually moderating further

According to official data, annual real growth in China's gross domestic product (GDP) decelerated to 6% in the third quarter. The gradual slowdown in growth that began in the second quarter of 2018 has thus continued. The fairly weak international environment continued to act as a major drag on growth. In the past quarter, revenues from goods exports to the United States were down by 15% in US dollar

Deutsche Bundesbank

terms chiefly due to the trade dispute. Exports to other countries likewise remained lacklustre. In order to support economic activity, the Chinese government has ushered in various expansionary measures since the beginning of the year. These focused on strengthening households' purchasing power. For example, income tax and value-added tax were lowered. For consumers, however, this tax relief was eaten into by considerable rises in expenditure for food. In particular, pork prices surged in recent months due to rampant swine fever. As a result, the rate of inflation as measured by the consumer price index (CPI) increased significantly in October to 3.8%. This was the sharpest rise in prices since the beginning of 2012.

In India, economic activity in the third quarter, for which there is not yet an official GDP estimate, is likely to have lost more momentum. In

Economic activity in India likely to have lost more momentum the second quarter, GDP growth had already fallen considerably to 5% on the year. The crisis in the Indian shadow banking industry was the main reason behind this renewed slowdown. Shadow banks play an important role in the supply of credit to households and small enterprises in India. This is especially true for motor vehicle financing. As a result, sales of passenger cars dropped by 30% on the year in the third quarter. Industrial production also fell below the previous year's level due to the slumping motor vehicle sector. At 3.5%, annual consumer price inflation in the previous quarter remained fairly weak by Indian standards. In light of the dampened inflationary pressures and the tensions in the financial sector, the Reserve Bank of India maintained its accommodative stance.

Recovery in Brazil appears to be continuing In Brazil, economic output is likely to have seen moderate growth again in the third quarter after rising in the second quarter by a seasonally adjusted 0.4% on the quarter. Output in the mining sector, which had experienced massive losses as a result of a dam collapse at the beginning of the year, largely returned to normal levels. Sentiment among purchasing managers in the manufacturing sector also brightened noticeably. In addition, the major pension reform passed in October improved the longterm prospects for Brazilian public finances. In light of the persistently restrained annual consumer price inflation, which was 2.9% in September, the Central Bank of Brazil once again loosened its monetary policy to a considerable degree. This move left the policy rate at a record-low 5%.

Underlying cyclical trend remains muted in Russia The Russian economy built up distinct momentum in the third quarter. According to an initial estimate by the Russian Federal State Statistics Service, real GDP saw annual growth of 1.7% after having recorded gains of just 0.9% in the second quarter. This stronger growth is likely to have been largely attributable to one-off factors, such as a plentiful harvest in particular. Until recently, growth in private consumption had been highly subdued and was likely to

have still been restrained by the value-added tax hike introduced at the beginning of the year. Investment activity likewise remained weak. The implementation of what are known as "national projects" – which comprise an ambitious, medium-term infrastructure programme⁴ – has seen only sluggish progress so far. Consumer price inflation fell to 4.3% on the year in the third quarter. Against this backdrop, the Bank of Russia cut its policy rate in four steps by a total of 125 basis points to 6.5% at the end of the reporting period.

United States

In the United States, the robust overall economic upturn maintained its pace and continued in the third quarter. According to an initial official estimate, real GDP was again up by 0.5% from the preceding quarter. Burdens imposed by foreign trade and changes in inventory, which had previously hampered growth, did not persist. Growth in domestic final demand, however, was not entirely able to maintain the rapid pace seen in the second quarter. The renewed decline in industrial gross fixed capital formation played a role in this context.5 In addition, public demand and private consumption grew less strongly. This contrasted with an upturn in private housing construction - in some cases, the weakness in this sector had been interpreted as a harbinger of a potential recession.⁶ Against the background of more favourable financing conditions, housing construction investment saw marked expansion again for the first time in almost two years. This recovery could continue in the coming quarters, especially as the US Federal Reserve System lowered the fed funds rate by an add-

Continued solid economic growth

⁴ The Russian government has designated funds corresponding to just under US\$400 billion for the investment programme up until 2024. The programme is intended to focus on expanding the road network, the rail network, seaports and airports.

⁵ In this context, sharp declines were again recorded in the mining and aviation sectors. However, investment dynamics remained listless in other sectors, too.

⁶ See Emmons (2018, 2019).

itional 25 basis points at the end of October. The persistently good situation on the labour market is also likely to continue to prop up household demand. At the start of the fourth quarter, the unemployment rate remained at the very low level seen in the third. In line with this, domestic inflationary pressures were still fairly strong until recently. In October, the annual growth rate of CPI excluding energy and food stood at 2.3%.

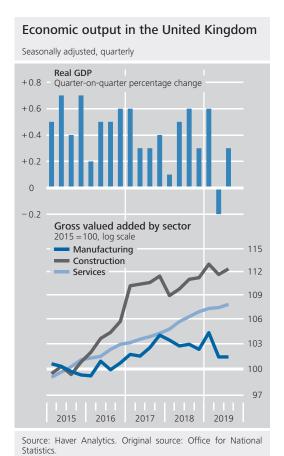

Japan

Growth almost comes to standstill

In Japan, economic growth almost came to a standstill in the third quarter. According to an initial official estimate, seasonally adjusted real GDP grew by only 0.1% over the previous period after still having risen fairly briskly in the two preceding quarters. Despite the anticipatory effect in the run-up to the increase in value-added tax on 1 October 2019, the rate of private consumption growth in the third quarter could not quite match that of the preceding period. By contrast, industrial investment and expenditure for private housing construction were expanded to a greater degree. Private final demand, which was fairly brisk on the whole, was partially serviced using stockpiled goods, however. Furthermore, the decline in exports took its toll on economic output. Despite a slight increase, the rate of unemployment remained at an exceptionally low level in September. Although the labour market situation continued to be favourable, wages still saw virtually no growth compared to the previous year. Accordingly, consumer price inflation remained subdued. In September, the annual rate of change in CPI excluding energy and food stood at 0.3%. Against this backdrop, the Bank of Japan maintained its accommodative stance.

United Kingdom

UK economic output rose again in the third quarter. According to an initial estimate, real

Deutsche Bundesbank

GDP grew by a seasonally adjusted 0.3% over the previous quarter after having contracted slightly further in the second quarter. Key to this was a slight improvement in growth in the services sector, which makes a significant contribution to national gross value added. In addition, production in the manufacturing sector stabilised; this sector had been in sharp decline in the previous period due to the United Kingdom's planned withdrawal from the EU, which had originally been scheduled for the end of March. Construction activity also recorded distinct growth. The situation on the labour market still appeared exceptionally good; in the third quarter, unemployment was, at 3.8%, at its lowest level so far in the current cycle. The year-on-year change in the Harmonised Index of Consumer Prices (HICP) fell to 1.5% at the current end. Although the contours of an orderly exit of the UK from the EU have become more clearly visible in light of the renegotiation of the Withdrawal Agreement in October, sentiment amongst entrepreneurs and consumers

Economic output rises again deteriorated markedly towards the end of the reporting period. Even in the event of an exit under these conditions, the National Institute of Economic and Social Research (NIESR) anticipates considerable GDP losses of around 3½% compared with the UK remaining a member of the EU.7

Poland

Upturn continuing, marked rise in consumer prices In Poland, economic expansion picked up steam again in the third quarter. Real GDP grew by 1.3% from the preceding guarter after seasonal adjustment. This growth was bolstered by the ongoing favourable labour market situation, the continued strong wage growth and the additional social benefits ahead of parliamentary elections. The unemployment rate declined further in the third guarter to just 3.3% after seasonal adjustment. Nevertheless, the Polish economy did not remain unaffected by the global slowdown in the industrial sector. Industrial production contracted by a seasonally adjusted 1.3% compared with the preceding guarter, and industrial confidence fell to its lowest level since the start of 2017. Inflation firmed distinctly. The consumer price index (CPI) increased by 2.6% in September on the year; excluding energy and food, this figure stood at 2.4%. The core rate one year earlier had been 0.8%. The Polish central bank left its policy rate unchanged as before.

Macroeconomic trends in the euro area

Economic growth only moderate According to Eurostat's flash estimate, euro area GDP grew in the third quarter, as in the second, by 0.2% on the quarter after seasonal adjustment. After having risen by 0.4% in the first quarter, which was also due to temporary one-off effects, the underlying pace is likely to be assessed as somewhat lower than in the first half of the year. The further decline in the sentiment indicators suggests this as well. Annual GDP growth remained unchanged at 1.2%

in the third quarter, and thus lagged slightly behind the potential growth rate of 1.3% estimated by the European Commission. The main reason for this merely moderate economic growth was the ongoing downturn in the manufacturing sector. This was weighed down by lacklustre global investment dynamics, in part as a result of the elevated risk stemming from still simmering trade disputes. The weakness in the industrial sector also spilled over to services sectors in business-related areas. By contrast, favourable financial conditions as well as the continuing resilient growth in household income provided support. So far, there are no indications that economic growth in the euro area could accelerate distinctly in the fourth guarter of 2019 and the first guarter of 2020. Instead, the business climate in the industrial and services sectors faltered slightly yet again in October, and the negative factors emanating from the global setting persisted.

Consumption activity has been rather robust so far when compared with the subdued aggregate growth. Private consumption growth is likely to have been moderate in the third guarter as well. Retail sales, after price and seasonal adjustment, were up less strongly in the third quarter than in the second quarter, while the number of new motor vehicle registrations rose steeply.8 The underlying conditions for private consumption also remain favourable given the positive labour market situation and the distinct increase in real disposable income. That said, households' expectations regarding future economic developments deteriorated according to the European Commission's survey. This might have prompted additional saving.

Investment in the euro area (excluding Ireland) also presumably continued to go up, albeit not

Investment up less strongly

Moderate growth in private consumption

⁷ See National Institute of Economic and Social Research (2019). According to NIESR, some of these losses expected over the medium term have already materialised as a result of uncertainty effects.

⁸ It may also be connected to the switchover to the new emissions standard EVAP (Evaporative Emissions) as of September. At all events, the number of registrations rose steeply in August and then dropped off in September.

at the same pace as in the preceding quarter.9 In any case, the domestic sales achieved by capital goods producers grew markedly in July and August, and imports of capital goods from the rest of the world picked up significantly. Positive financing conditions and fiscal investment incentives in some countries¹⁰ are likely to have been beneficial and to have mitigated flagging industrial capacity utilisation. Construction investment, on the other hand, does not appear to have exceeded the previous quarter's levels. At all events, construction output stagnated in July and August. The European Commission surveys likewise point to a slackening in construction activity in the third quarter.

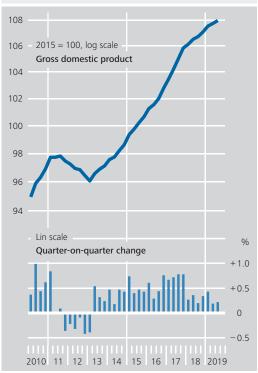

Exports to third countries up in value only slightly

On the whole, foreign trade remained lacklustre in the third quarter as well. While exports of goods to non-euro area countries increased slightly in terms of value after seasonal adjustment, intra-euro area trade tailed off markedly. Exports to the United States remained brisk, and deliveries to the United Kingdom recovered from their second-quarter setback.11 However, exports to China were down for the second consecutive quarter. As export prices barely changed, the volume of exports to non-euro area countries is also likely to have picked up somewhat. Consumer goods exports, in particular, increased in July and August (including food and pharmaceutical products), while exports of capital goods fell considerably for the third time in succession. The reduction in intraeuro area trade primarily impacted intermediate goods. This reflects the great importance of cross-country value chains in the euro area's manufacturing sector. In contrast, intra-euro area trade in consumer goods saw a visible increase. Imports from third countries remained sluggish, though there was a rise in capital goods imports.

Further decline in industrial production, slowdown in services growth The downward slide in industrial production continued in the third quarter. The production of intermediate goods saw an especially sharp decline. This area has been mired in a slump since the start of 2018. Likewise, consumer

Price and seasonally adjusted, quarterly data

Source: Eurostat. * Affected by a level shift in Irish GDP from Q1 2015 onwards.

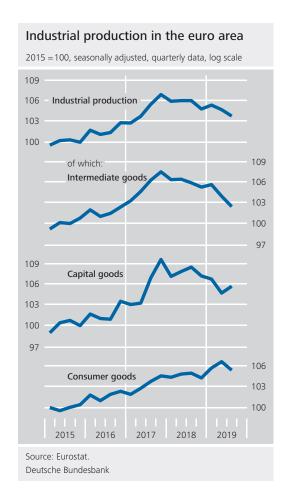

Deutsche Bundesbank

goods output also went down considerably, although the production of capital goods experienced a distinct increase. In this context, the number of passenger cars rolling off assembly lines continued to decrease markedly, while the manufacture of other transport equipment was stepped up. The momentum in the services sectors waned somewhat in July and August. The level of activity in the transport sector and among professional, scientific and technical services is likely to be affected more and more by the sluggish activity in the industrial sector.

⁹ For the euro area as a whole, gross fixed capital formation is likely to have decreased in the third quarter as Ireland had again recorded considerable investment in intellectual property rights in the preceding quarter. Gross fixed capital formation in Ireland has been very volatile for several years due to the activities of multinational enterprises. By excluding Ireland from the analysis, the cyclical trend in the euro area becomes more apparent. See Deutsche Bundesbank (2018).

¹⁰ This includes, in particular, the special depreciation rules reintroduced in Italy in April.

¹¹ This was due to increased stockpiling prior to the original date scheduled for the United Kingdom's withdrawal from the European Union.

Pace of growth stable in many Member States compared with preceding quarter In the third guarter, many Member States had similar GDP growth rates to the preceding quarter. The French economy maintained its moderate growth with a rise of 0.3% compared with the second quarter. The increase in private consumption accelerated slightly. Investment picked up again distinctly, albeit at a somewhat less buoyant pace than in the previous quarter. Exports rose again after a period of weakness, and imports even expanded significantly. Italy recorded a small increase in economic activity, as in the preceding quarter. The biggest contribution to growth probably came from investment activity, which had been boosted by special depreciation rules reintroduced in April. That said, private consumption is likely to have expanded moderately at most. In any event, real retail sales were up only slightly in the third quarter. On the other hand, goods exports, which had still been supporting economic activity in previous quarters, contracted after adjustment for prices. In the third quarter, the Spanish economy grew again by 0.4% on the quarter. Investment in machinery and equipment as well as private consumption picked up steam again after a weak previous quarter. By contrast, exports recorded a distinct decline here, too. Imports increased significantly in line with buoyant domestic demand. The Netherlands, Belgium and Austria likewise recorded virtually unchanged GDP growth rates.

The sluggish cyclical development is becoming increasingly noticeable in the euro area labour markets. According to Eurostat's flash estimate, the number of persons in employment rose in the third guarter by a mere 0.1% on the guarter after seasonal adjustment, and the number of unemployed persons decreased by just 70,000. However, the standardised unemployment rate of 7.5% also exceeded its cyclical trough prior to the global financial and economic crisis by just 0.2 percentage point. Labour shortages in the manufacturing and services sectors were still perceived as constraints, albeit no longer to the same extent as in the first half of the year. Wage growth is likely to have weakened slightly in the third quarter.

Only slight improvement in labour market situation

Consumer prices in the euro area rose moderately in the third quarter by 0.2% on the quarter after seasonal adjustment after still seeing strong growth of 0.5% in the second quarter. Energy prices, which had declined markedly due to low crude oil prices, were a key factor in this slowdown. By contrast, food prices rose even more sharply than in the preceding quarter. Consumers also had to pay noticeably more for services, while prices for non-energy industrial goods increased only slightly. Annual consumer price inflation (HICP) dropped considerably from 1.4% to 1.0%. Amongst other things, this was due to a base effect caused by the extremely sharp rise in energy prices in the third quarter of 2018. The rate excluding energy and food contracted from 1.1% to 0.9%, which was largely attributable to a statistical one-off effect in the German sub-index for package holidays.12 If the prices for the volatile travel and

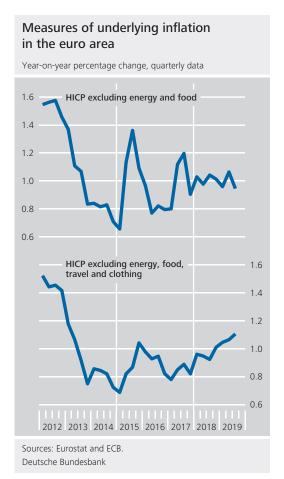

Energy and statistical one-off effect dampening consumer price inflation in Q3 clothing components are also factored out, this indicator of underlying inflation remained unchanged recently at 1.1%.

Annual consumer price inflation in October dampened by energy; core rate up

In October, consumer prices rose by a seasonally adjusted 0.1% from the preceding month. Prices for services and energy were up slightly, while food and non-energy industrial goods prices remained unchanged. The annual rate of change in HICP declined to 0.7% owing to another base effect caused by energy prices. In contrast, the rate excluding energy and food increased to 1.1%.

No improvement in cyclical outlook so far

There are very few signs that the euro area will experience any distinct acceleration in economic growth in the fourth quarter of 2019 and the first quarter of 2020. Instead, sentiment continued to deteriorate amongst enterprises and households up until October, according to the European Commission surveys. While confidence remained at its aboveaverage level among consumers, in the manufacturing sector it was markedly below its longterm average. A similar picture emerges from the purchasing managers' index for the economy as a whole, which was only slightly above the expansion threshold. In the manufacturing sector, where the current situation and outlook are considered to be especially poor, there have nevertheless been recent signs of stabilisation. The survey results also suggest, moreover, that the economic slowdown in the industrial sector

is increasingly spilling over to the services sector. From this perspective, the growth outlook for the last quarter of 2019 and the first quarter of 2020 remains subdued. That said, a number of political risks may diminish in the global setting and in the euro area, which could strengthen confidence again.

Two-tier system

for reserve

remuneration

Monetary policy and banking business

Monetary policy and money market developments

ECB Governing Council lowers deposit rate to -0.5% and adjusts forward quidance At its monetary policy meeting in September 2019, the Governing Council of the ECB adopted an extensive package of measures based on its assessment of the economic and inflation outlook. It lowered the interest rate on the deposit facility by 10 basis points to -0.5%, but kept the interest rate on main refinancing operations and the rate on the marginal lending facility unchanged at 0% and 0.25%, respectively. At the same time, it adjusted its forward guidance on future key interest rates. The Governing Council now expects key interest rates to remain at their present or lower levels until it has seen the inflation outlook robustly converge to a level sufficiently close to, but below, 2% within its projection horizon, and such convergence has been consistently reflected in underlying inflation dynamics.

Resumption of net purchases under APP Moreover, the Governing Council decided to restart net purchases under its expanded asset purchase programme (APP) at a monthly pace of €20 billion as from 1 November 2019. It expects these net purchases to run for as long as necessary to reinforce the accommodative impact of its policy rates, and to end shortly before it starts raising the key ECB interest rates. There was no change to the Governing Council's forward guidance on the reinvestment of the securities already purchased.

Change to TLTRO III terms

To provide further support for its accommodative monetary policy stance, the Governing Council of the ECB decided to adjust the modalities of the third series of targeted longer-term refinancing operations (TLTRO III). It extended the maturity of the individual operations from two to three years and removed the previously planned interest rate premium of 10 basis points. For banks whose eligible net lending exceeds a benchmark, the interest rate in each operation can now be as low as the

average interest rate on the deposit facility prevailing over the life of the operation. The adjustments are intended to maintain favourable bank lending conditions and ensure the smooth transmission of monetary policy.

In order to provide additional support for the bank-based transmission of monetary policy, the Governing Council decided to introduce a two-tier system for reserve remuneration. Under this system, part of banks' holdings of excess liquidity on current accounts with the Eurosystem is exempt from the negative deposit facility rate and remunerated at 0%. The volume of reserve holdings in excess of minimum reserve requirements that is exempt from the negative deposit facility rate for each institution is determined as a multiple of that institution's minimum reserve requirements. The multiplier is the same for all institutions and has initially been set at 6. The two-tier system was first applied in the seventh maintenance period of 2019, starting on 30 October 2019.1 Both the remuneration rate of the exempt tier and the multiplier can be changed over time.

The measures the ECB Governing Council adopted in September were taken in response to the continued shortfall of inflation with respect to its aim. According to the Governing Council, the incoming information indicates a more protracted weakness of the euro area economy, the persistence of prominent downside risks and muted inflationary pressures. The September Eurosystem staff projections likewise pointed to a further deterioration in the inflation outlook. At the same time, however, robust employment growth and increasing wages continued to underpin the resilience of the euro area economy.

The APP holdings recorded on the balance sheet continued to fluctuate slightly over the

Money market management and liquidity needs

The two reserve periods between 31 July 2019 and 29 October 2019 saw euro area liquidity needs stemming from autonomous factors increase slightly (see the table below). At an average of €1,434.2 billion in the September-October 2019 period, they stood €15.5 billion above the average for the June-July 2019 period, the last reserve maintenance period prior to the reporting period. The sum of the autonomous factors remained volatile and fluctuated within a range of €1,381.5 billion and €1,472.4 billion over the two periods considered. The higher volume of banknotes in circulation in the Eurosystem was the main factor behind the additional liquidity needs. This volume increased by €11.9 billion to an average of €1,252.7 billion in the September-October 2019 reserve period (see the chart on p. 24). By contrast, government deposits, which increased by €2.7 billion to an average of

€298.6 billion, remained virtually unchanged on balance. The change to the combined total of net foreign assets and other factors, which are considered together owing to liquidity-neutral valuation effects, was smaller still. Here, additional liquidity absorption amounted to just €0.9 billion. Furthermore, the rise in the minimum reserve requirement also caused an increase in banks' calculated need for central bank money. The minimum reserve requirement rose by €1.8 billion to €133.2 billion during the September-October 2019 reserve period.

The total outstanding tender volume from the Eurosystem's open market operations declined further and stood at just over €670 billion on average in the September-October 2019 period, around €34 billion below the average for the June-July 2019 period (see

Deutsche Bundesbank

the chart on p. 25). The ECB Governing Council's interest rate decision (see p. 21) had no impact on the standard tender operations. However, this decision affected the lowest rate of interest payable on the third series of targeted longer-term refinancing operations (TLTRO III), the modalities of which were also adjusted by the ECB Governing Council (see p. 21). On 25 September 2019, the first of seven TLTROIII operations was settled; however, with 28 institutions taking up a volume of €3.4 billion, demand was only small. This was mainly attributed to credit institutions not having the chance to react to the ECB Governing Council's improvement to the conditions, as the key deadlines had already expired.

On the same day as the first TLTRO III, voluntary early repayments totalling €31.8 billion were settled on the still outstanding TLTRO II series, meaning that net liquidity of €28.4 billion was absorbed. During the reference period, there was also a decline in the central bank liquidity provided in the regular tender operations. For instance, demand for main refinancing operations decreased on average by €2.6 billion to an average of just €2.0 billion compared with the June-July 2019 reserve period. Demand for the three-month tenders also fell by €0.5 billion to €2.8 billion.

However, the Eurosystem continued to provide the bulk of central bank liquidity through its asset purchase programmes. The average balance sheet holdings of these programmes amounted to €2,609 billion during the September-October 2019 period, representing a share of almost 80% of Eurosystem central bank liquidity provided through open market operations. This represented a decline of roughly €12 billion compared with the corresponding average holdings in the June-July 2019 reserve period, which was due to amortisation ad-

Deutsche Bundesbank

lion down on the June-July 2019 period. With the resumption of the asset purchase programmes in November 2019, increasing liquidity provision is likely to boost excess liquidity. Liquidity effects from the refinancing operations, particularly the TLTROs, remain another important determinant here. The end of the period under review saw excess liquidity holdings shift from the deposit facility to current account holdings (see the table on p. 22). This shift from one component of excess liquidity to the other is probably linked to the introduction of the two-tier system for reserve remuneration (see p. 21). As expected, the actual introduction of the system in the current reserve period reinforced this development to a considerable degree (see the chart on p. 25).

The lowering of the deposit facility rate was transmitted in full to the secured and unsecured money market rates at the beginning of the September-October 2019 reserve period. Thus, overnight rates in the euro money market continued to be geared to the rate on the deposit facility (see the chart on p. 23). The same applies to the euro short-term rate (€STR), the new reference rate for unsecured overnight money first published for 1 October 2019. The

€STR stood at an average of -0.55% until the end of the September-October 2019 maintenance period. The methodology for calculating the EONIA was changed with the publication of the €STR (see the box on p. 27), but this did not affect the spread between the EONIA and the deposit facility rate. In the September-October 2019 reserve period, the EONIA stood at an average of -0.46% (previous reserve period July-September 2019: -0.36%). At €2.0 billion, EONIA turnover remained at a low level in the reporting period (up to and including 30 September). The average underlying turnover for the calculation of the €STR (from 1 to 29 October) was €32.6 billion.

On average, secured overnight money traded at the level of the deposit facility rate. On the GC Pooling platform, overnight trades in the ECB basket were executed at -0.50% on average in the September-October 2019 period and thus were 10 basis points lower than in the previous period (July-September 2019). Overnight money in the ECB EXTended basket, with its larger set of eligible securities, traded at an average of -0.49% in the September-October 2019 period. In the same period, aggregate overnight turnover across both segments was €7.2 billion on average, and therefore below the figure of €9.7 billion recorded in the previous reporting period.

Sources: ECB and Bundesbank calculations. 1 Securities markets programme (SMP), covered bond purchase programmes (CBPP1, CBPP2 and CBPP3), asset-backed securities purchase programme (ABSPP), public sector purchase programme (CSPP) and corporate sector purchase programme (CSPP). 2 Current account holdings minus the minimum reserve requirement plus the deposit facility. 3 Volume so small it is hardly visible. 4 The marginal lending facility is not shown in this chart owing to its very low volume. Deutsche Bundesbank

Little change in securities holdings recognised on balance sheet period. This was due to two factors: the smoothing over time of reinvestments in line with the technical parameters agreed upon in December, and the use of amortised cost accounting.² On 8 November 2019, the stock of APP assets held by the Eurosystem reached a total of €2,558 billion (a breakdown of these holdings by individual asset purchase programme can be found on p. 23). However, with new purchases starting at the beginning of November, the stocks will continue to increase.

Participation in first TLTRO III operation muted

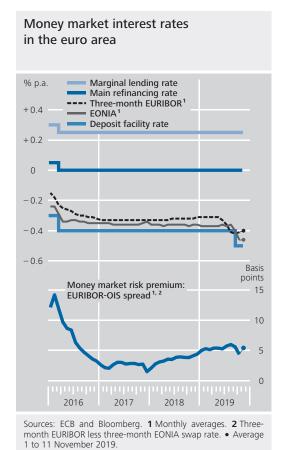

Demand for the first TLTRO III operation, settled on 25 September, was very low, with 28 banks taking up €3.4 billion in total. At the same time, €31.8 billion was paid back on the second series of targeted longer-term refinancing operations (TLTRO II) under the voluntary repayment option. This resulted in a negative net liquidity effect. Together, the TLTRO II and TLTRO III series currently have an outstanding volume of around €661 billion. Before the conditions for TLTRO III operations were adjusted in

September, they were less attractive than those for the TLTRO II series. Prior to the September meeting, many banks therefore had an incentive to postpone the transition from TLTRO II to TLTRO III. These circumstances suggest that the limited demand for the first TLTRO III could be explained by the fact that the conditions for the operation were modified only shortly before it was launched. Given that the deadlines for various reporting requirements had passed, counterparties were unable to participate in the first TLTRO III operation unless they already met the requirements. As a result, demand for the second TLTRO III operation, which will be settled in December, is expected to be higher.

Excess liquidity increased and, at €1,815 billion, was slightly higher than at the end of the last reporting period. Looking ahead, the resump-

Slight rise in excess liquidity

² In particular, the difference between an asset's acquisition and redemption value is amortised over the residual maturity, treated as part of interest income and thus measured at (amortised) cost.

ward shift in the yield curve. This upward movement suggests that expectations of a further decline in interest rates are tailing off. Forward rates continued to rise in the weeks after the meeting, most likely owing to market participants' dwindling expectations of falling interest rates based on what they perceived as positive news about the Brexit negotiations and the US-China trade disputes. At present, based on the forward rates, a further cut to the deposit facility rate by 10 basis points is no longer fully priced in. In the surveys carried out before the October meeting, in median terms, market participants expected the deposit facility rate to be lowered by a further 10 basis points in the first or second quarter of 2020. However, the survey results also suggest that uncertainty about a further interest rate cut has grown, as expectations, which were previously focused heavily on December 2019, now vary more widely and only a small overall majority of respondents still anticipate a further reduction.

ary policy meeting, there was a marked up-

tion of net purchases under the APP from the beginning of November means that excess liquidity will probably rise more sharply again. However, its path will also depend on demand by banks for TLTRO III operations and use of the early repayment option under TLTRO II.

Deutsche Bundesbank

Complete passthrough of decrease in deposit facility rate to shortterm money market rates

On 18 September, the deposit facility rate was lowered to -0.5%. The unsecured overnight money market rate (EONIA) mirrored the reduction almost completely and has fluctuated within a range of -0.45% and -0.47% since then. The introduction of a new methodology for calculating the EONIA (see the box on p. 27) has so far had no significant impact on the spread between the EONIA and the rate on the deposit facility.

Having fallen further in the weeks leading up to the September meeting, money market forward rates rose significantly in the latter part of the reporting period. On 12 September itself, the day of the ECB Governing Council's monet-

Monetary developments in the euro area

The broad monetary aggregate M3 recorded strong inflows in the third quarter of 2019 as well, continuing its robust growth. Lending to the domestic private sector and inflows of funds from abroad were once again the main drivers of growth. While the expansion of loans to households continued its upward trajectory, growth in lending to non-financial corporations was dampened somewhat by the persistent economic slowdown in the euro area. According to the latest bank lending survey (BLS), banks' lending policies remained largely unchanged on balance in both corporate and retail banking during the reporting quarter.

Among the components of M3, overnight deposits again accounted for by far the largest inflows in the third quarter. In addition, investors stepped up their holdings of cash, short-

Q3 2019 sees continued robust monetary growth

Households' overnight deposits still main driver of inflows to M3

Significant increase in money market forward rates of late

New methodology for calculating the EONIA since 2 October 2019

As of 2 October 2019, the European Money Markets Institute (EMMI) has published the unsecured overnight rate on the interbank money market (euro overnight index average, or EONIA) based on a new methodology.1 EONIA is an important reference interest rate for the euro. It has, to date, been defined as the interest rate at which sound banks within the European Union and the European Free Trade Association (EFTA) issue unsecured loans in the interbank overnight money market denominated in euro. Up until 30 September 2019, the ECB calculated the EONIA on behalf of EMMI as the weighted average interest rate on the reported lending volumes and average interest rates of a panel comprising 28 banks at last count.

Using the old methodology, the EONIA would, after 2020, no longer have complied with the criteria set out in the EU Benchmarks Regulation. Back in September 2018, the private sector working group on euro risk-free rates² therefore recommended using the euro short-term rate (€STR), which is calculated and provided by the ECB based on European Money Market Statistical Reporting (MMSR), as the risk-free short-term euro reference interest rate going forward.³

The new €STR interest rate differs from the EONIA in key features. While the EONIA was based on the terms in interbank lending (lending concept), the €STR reflects banks' wholesale unsecured borrowing costs (borrowing concept). Hence, the €STR includes not just interbank transactions but also banks' borrowing from other non-bank financial enterprises (for instance money market funds). Consequently, as the €STR also includes a large proportion of interest rates on transactions with financial enterprises that do not have access to the Eurosystem's deposit facility, the €STR is trading slightly below the deposit facility rate in the current environment of high excess liquidity. At high levels of excess liquidity, the EONIA as calculated using

the old method, meanwhile, was always several basis points above the deposit facility rate, as there is usually no incentive for banks with access to the deposit facility to issue interbank loans at a lower interest rate.

In order to ensure a smooth and gradual transition from the EONIA to the €STR, the working group in March 2019 recommended adjusting the methodology used to compute the EONIA for an interim period.⁴ For a transitional period from the first publication of the €STR on 2 October 2019 onwards,⁵ EMMI will calculate the EONIA daily as the €STR plus a fixed spread of 8.5 basis points. This spread was calculated as the average difference between the two concepts during a one-year reference period and was fixed and published by the ECB in May 2019.6

As a result of the temporary parallel publication of the EONIA in accordance with the new methodology and the €STR, EONIA can still be used for financial contracts for a limited period. The working group recommends that market participants gradually replace the EONIA with the €STR in all products and contracts and, going forward, use the €STR as the standard reference interest rate. Publication of the EONIA is to be discontinued on 3 January 2022

¹ See European Money Markets Institute (2019).

² The working group on euro risk-free rates was set up by the ECB, the Belgian Financial Services and Markets Authority (FSMA), the European Securities and Markets Authority (ESMA) and the European Commission in 2018. Its main task is to identify and recommend alternative risk-free interest rates and transition paths. It is led by industry representatives, and the ECB provides the secretariat.

³ See European Central Bank (2018).

⁴ See European Central Bank (2019b).

⁵ The publication on day T+1 reflects transactions of the previous day, i.e. on 2 October 2019, the €STR for the reference date of 1 October 2019 was published.

term savings deposits and money market fund shares. The increase in sight deposits dominated the overall picture, however. Once again, inflows from households made the largest contribution to this increase. As before, these investors' marked preference for the shortest possible maturities probably stemmed from the narrow interest rate spreads between the different types of deposit and the uncertainty that continued to surround the economic outlook in the third quarter, too. The annual growth rate of M3 thus stood at 5.5% at the end of September.

Loss of momentum in loans to non-financial corporations

Among the M3 counterparts, loans granted to the domestic private sector, adjusted for sales and securitisation, recorded the largest net inflows. Their contribution to the annual growth rate of M3 rose to 3.5 percentage points at the end of the quarter. However, compared with the strong second quarter, net inflows slackened slightly. This applied mainly to loans to non-financial corporations, with the annual growth rate for this credit segment sinking to 3.7% at the end of the guarter. Net inflows at banks in Germany and France, in particular, were smaller, probably due to the gloomier economic situation. In addition to this, net outflows in Italy increased, which may have been attributable, among other things, to an improvement in Italian enterprises' liquidity situation as a result of tax relief measures, despite similarly weak growth.

According to the information provided by the banks surveyed in the BLS, neither lending policies nor the demand for loans from enterprises changed notably in the euro area on balance. Although the surveyed banks tightened their credit terms and conditions slightly overall, they simultaneously marginally eased their standards for lending to enterprises. Interest rates for loans to enterprises reached new historic lows in the third quarter. This is consistent with the view expressed by the banks surveyed in the BLS that demand for corporate loans was primarily bolstered by the low general level of interest rates. Conversely, the surveyed banks reported that their financing needs for fixed investment were now contributing only marginally to the increase in demand. Taken in isolation, declining financing needs for inventories and working capital as well as the use of alternative sources of funding pushed down demand.

Adjusted for sales and securitisation, loans to households recorded substantial net inflows again in the reporting period, representing the largest contribution to growth in loans to the private sector. Although the momentum of consumer credit slowed somewhat, inflows to

Marked rise in loans to house-

On balance. lending policies

and demand for

loans virtually unchanged

in Q3

holds continues

loans for house purchase, which are a great deal more substantial, were perceptibly higher than the previous quarter's. Once more, the euro area banks participating in the BLS attributed the observed rise in demand for housing loans to the low general interest rate level and the positive outlook for both the residential property market and its price movements. On balance, this resulted in a further slight increase in the annual growth rate of loans to households to 3.4%. Banks in France and Germany continued to post the highest net inflows, although Italy, too, recorded noteworthy net gains.

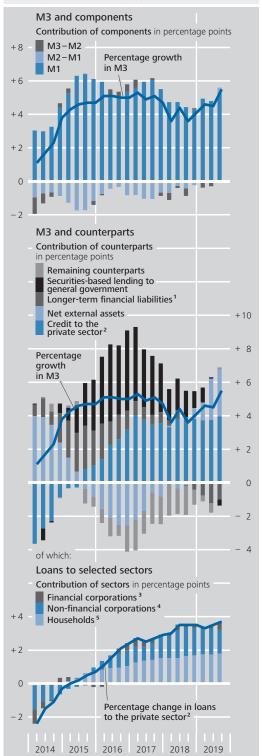

Standards for loans for house purchase almost unchanged According to the BLS results, the standards for loans for house purchase in the euro area remained almost unchanged in the reporting period. By contrast, overall credit terms and conditions were tightened marginally on balance for the first time since the introduction of this separate survey category in April 2015. This was brought on, in part, by the surveyed banks widening their margins, especially on riskier loans. On the whole, however, this did not entail a significant adjustment of lending policies.

M3 growth bolstered by demand for domestic paper among foreign investors The MFI sector's net external asset position, too, continued to markedly support monetary growth in the quarter under review. Besides the euro area's sustained current account surplus, M3 growth was also attributable to the slightly positive balance of portfolio investment. Based on the non-seasonally adjusted balance of payments figures available for July and August, foreign investors made net large-scale purchases of both longer-term bonds issued by domestic general government as well as shares and mutual fund shares issued by the domestic private sector. Domestic investors exhibited an interest in foreign bonds, in particular.

M3 also supported by securities in Q3 On balance, the MFI sector's securities-based lending likewise had a positive impact on monetary growth in the reporting quarter. Since the discontinuation of the monthly net purchases of securities by the Eurosystem at end-2018, the development of this counterpart has pri-

marily reflected commercial banks' investment behaviour. Bonds and debt securities, in particular, were accumulated, whereas equity experienced only a slight rise compared with the

previous quarter.

German banks' deposit and lending business with domestic customers

German banks' deposit business with domestic customers recorded another marked increase in the reporting quarter. As in previous quarters, this solid growth was supported by strong

net inflows into overnight deposits. Once again, it was households that showed a particular interest in this low-risk and highly liquid form of investment. The demand for overnight deposits was fuelled by the narrow spread on longer-term risk-free forms of investment, which dropped even further in the quarter under review. Non-financial corporations likewise further increased their holdings of overnight deposits – though not nearly by as much as households. In the corporate sector, the attractiveness of this type of deposit has tended to decrease in recent years due to the greater drop in the level of interest rates in this market segment, including into negative territory (see the box on pp. 31-32). All other types of deposit were scaled back further on balance. In particular, longer-term time deposits of insurance and pension funds recorded substantial outflows. These institutions have for some years reduced their holdings of bank deposits in favour of higher-yielding financial instruments.3

German banks' deposit business still dominated by build-up of overnight deposits

In the reporting quarter, German banks also significantly expanded their lending business with the domestic non-bank sector, albeit to a somewhat lesser extent than in the previous three-month period. The net increase - as in the preceding quarters – stemmed solely from lending business with the domestic private sector. This expansion was attributable not only to loans but also to a greater number of securitised loans being granted, especially to financial corporations. The prolonged reduction of securities-based lending to general government which had started in autumn 2015 came to a temporary halt in the quarter under review. Loans to general government, on the other hand, continued to decline, albeit on a relatively small scale.

Significant expansion in lending business

In the summer months, the expansion of loans to the private sector was predominantly supported by lending to households, particularly in the form of loans for house purchase. ConConsistently high demand for loans for house purchase

³ For background information, see Deutsche Bundesbank (2019), pp. 32 f.

Negative interest rates on the deposits of non-financial corporations and households in Germany

The aggregate interest rate on the overnight deposits of non-financial corporations calculated in the MFI interest rate statistics¹ has been in negative territory since November 2016. By contrast, the interest rate on the overnight deposits of households has continued to be marginally positive, on average, as has the remuneration of time deposits.²

The MFI interest rate statistics calculate the level of interest rates applied to nonfinancial corporations and households (as well as the corresponding volumes) on a monthly basis. The data collection is designed to be a representative sample and each of the currently roughly 220 banks in the sample reports its volume-weighted average interest rates for the individual deposit items to the Bundesbank. It is therefore not possible to calculate how many banks in Germany have introduced negative deposit rates based on the data included in the MFI interest rate statistics. However, because the sample is representative, extrapolation does allow qualified conclusions to be drawn regarding the distribution in relative terms of negative interest rates across customer deposits in the German banking sector.

According to the data, 58% of reporting institutions reported a negative volume-weighted average interest rate on overnight deposits held by enterprises in September

deposits held by enterprises in September

1 See Deutsche Bundesbank (2017), pp. 93 ff.
2 While negative effective interest rates first appeared in the MFI interest rate statistics in 2016, the negative real remuneration of households' bank deposits is not a new phenomenon. Over the past few decades, there have repeatedly been spells of negative real interest rates. The real deposit rate is an interest rate adjusted for inflation which reflects the increase in purchasing power resulting from the interest paid on the deposit.

See Deutsche Bundesbank (2017), pp. 101 ff.

2019. The sum of deposits at these institutions corresponds to 79% of the total volume of overnight deposits of enterprises at German banks. According to the reporting institutions, large-scale deposits, in particular, lead to negative volume-weighted average rates at bank level. Charging enterprises negative interest rates appears to be standard practice across almost all categories of banks.

In the case of households' deposits, the share of German institutions that reported a negative volume-weighted average interest rate stood at 23%, which represents a share of 25% of the total volume of overnight deposits of households at German banks. Negative interest rates are charged especially by big banks, savings banks and cooperative banks.

Bank deposits remunerated at a negative rate of interest in Germany %, month-end data: September 2019

Share of institutions Share of the deposit with a negative average volume remunerated interest rate at a negative rate of interest² Non-financial Households³ corporations 80 70 60 50 40 30 20 10 Overnight deposits Overnight deposits Time Time deposits deposits

Deutsche Bundesbank

In the case of time deposit holdings, these figures were significantly lower. On average, only around 10% of institutions reported negative interest rates on time deposits for enterprises and around 2% of institutions reported negative interest rates on time deposits for households. This represents volume shares of 19% and 1%, respectively.

Empirical studies on interest rate passthrough show that, in Germany, the interest rates on time deposits at the aggregate level are usually based on developments in short-term market interest rates (12-month EURIBOR), however, they exhibit a higher level.³ The 12-month EURIBOR has been in negative territory since February 2016 and sank to -0.34% at the end of September 2019. In the long term, just over 73% of changes in the market rate are passed through to the interest rate on the time deposits held by households and non-financial corporations. In the case of overnight deposits at the aggregate level, there is a long-term relationship with a market interest rate (EONIA) only for the deposits of non-financial corporations. This may indicate that developments in this deposit rate for households have decoupled from developments in market interest rates, particularly when the latter are negative, and, for the most part, a zero lower bound for deposit rates still applies de facto.

3 The interest rate for households' time deposits has been, on average, roughly 37 basis points above the level of the 12-month EURIBOR since 2003; for time deposits held by non-financial corporations, the spread was only around 3 basis points.

4 The interest rate on the overnight deposits of nonfinancial corporations has, on average, stood at around 15 basis points above the EONIA since 2003. The long-term pass-through is roughly 55%.

sumer credit again recorded substantial inflows as well, although its growth slowed down somewhat compared with the strong previous quarter. According to the banks surveyed as part of the BLS, demand in both credit seqments – as in the previous quarters – was supported, above all, by the low general level of interest rates. Interest rates on loans for house purchase with long rate fixation periods, for example, dropped to a new all-time low of 1.2% at the end of the third quarter. In addition, households maintained a positive outlook on the housing market and house price developments. On balance, the annual growth rate of loans to households continued to rise slightly to 4.2% as at the end of the quarter, constituting a year-on-year increase of ½ percentage point.

The latest BLS results indicate that banks' lending policies for retail customers remained broadly unchanged in the reporting quarter. In this context, the surveyed banks reported hav-

ing left their credit standards unchanged. However, they tightened the terms and conditions for loans for house purchase on aggregate for the second time in a row, after having almost continuously eased them since early 2017. This primarily had a bearing on margins, which were widened again — also for average-risk loans — for the first time since 2014.

Loans to non-financial corporations grew only slightly in the quarter under review. On the one hand, this was due to the fact that a part of the strong build-up of short-term loans seen in the preceding quarter was redeemed in the third quarter. On the other hand, longer-term loans, which had posted dynamic growth in the first half of the year, likewise recorded substantially lower net inflows in the summer months. One reason for this could be a weakening of investment activity, which had already been observed in the second quarter and may have continued into the third. On balance, the annual growth rate of loans to domestic enterprises fell dis-

Only slight increase in loans to non-financial corporations

Retail lending policies largely unchanged tinctly from 5.7% at end-June to 4.9% at end-September.

Demand chiefly supported by low interest rates Demand for loans to enterprises was propped up by the prolonged downward trend in interest rates in this credit segment, notably for longer lock-in periods. This is consistent with the BLS banks reporting that the low general level of interest rates fuelled credit demand even more in the quarter under review than one quarter earlier, according to their assessment. By contrast, demand was once again dampened by the decrease in financing needs for inventories and working capital and by companies tapping alternative sources of funding; however, the impact of the latter has been weakening discernibly since autumn 2018.

Corporate lending policies broadly unchanged Following a period of easing, which lasted from the beginning of 2017 to end-2018, the surveyed banks – according to the BLS – in the reporting quarter marginally tightened their lending policies in the corporate loan segment for the third consecutive time. The banks justified the adjustment of their standards, above all, with a more negative risk assessment of industry and firm-specific factors. In addition, they reported a deterioration in how they perceived the economic situation and the economic outlook, as well as higher capital costs. Taken as a whole, credit terms and conditions did not change, according to the surveyed banks. Nonetheless, the margins on riskier loans, in particular, but also on average exposures, were widened further.

Virtually no change in German banks' funding environment In reply to the ad hoc questions in the October BLS, German banks reported that their funding conditions had remained virtually unchanged compared with the previous quarter. However, banks reported that, viewed in isolation, the Eurosystem's expanded APP had slightly improved their liquidity position over the past six months, whereas it did not improve their market financing terms during this period. Furthermore, the programme weighed on banks' profit situation more heavily than during the last survey, although net purchases had been

Deutsche Bundesbank

discontinued at the start of the year. Just as in the previous survey round, the APP had no meaningful impact on lending policies and the credit volume in the two preceding quarters.

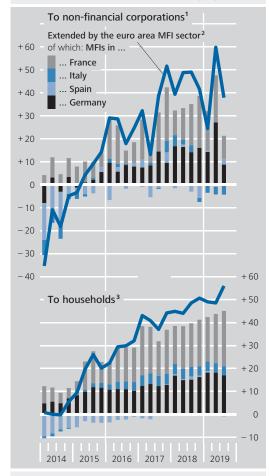

German banks' profitability strained by APP and ... In view of the ECB Governing Council's decision in September to resume net purchases from November 2019 onwards, the credit institutions were apprehensive of heavier strains on their profitability over the next six months. At the same time, they deem it likely that the APP will lead to an increase in credit volume in business with households. They do not expect their lending policies to be significantly affected, however.

... negative deposit facility rate

The negative deposit facility rate was again a key factor in banks' net interest income shrinking over the past six months due to its dampening impact on lending rates, amongst other reasons. Simultaneously, according to the banks' assessment, the negative deposit rate led to an increase in the volume of loans to both enterprises and households during this period, when viewed in isolation. Overall, the banks expect the negative effect of the deposit facility rate on net interest income to ebb off over the next six months as a result of the relief the two-tier system for remunerating reserve holdings is expected to provide, as mentioned by some of the banks. At this stage, notable positive effects on credit volume are only anticipated for loans to enterprises.

Financial markets

Financial market setting

Financial markets mainly influenced by monetary policy

Developments in global financial markets in the third and fourth quarters of 2019 have played out against the backdrop of shifting assessments of political risk as well as accommodative monetary policy decisions by central banks on both sides of the Atlantic. On balance, these factors drove down government bond yields for the most part amid some volatility. The drop in yields was fairly heavy in the United States, where the Federal Reserve lowered the interest rate corridor by a total of 0.75 percentage point in three stages during the reporting period. Yields on ten-year Federal bonds (Bunds) also dropped significantly at times, briefly touching all-time lows before bouncing back subsequently. Yield spreads of ten-year government bonds issued by other euro area countries over matched-maturity Bunds narrowed distinctly in some cases, especially in the case of Italian and Greek government paper. The brisk demand for fixed-income securities also provided tailwinds for European corporate bonds, whose yields fell strongly. In global equity markets, these lower yields combined with an increased investor appetite for risk and receding volatility pushed prices up considerably. Following downward revisions of analysts' earnings expectations in the reporting period, US firms in particular exceeded profit forecasts for the most part in the recently closed third quarter. In foreign exchange markets, the euro was slightly down on the end of June on balance when measured as a weighted average against the currencies of 19 major trading partners. The single currency's above-average losses against the US dollar, yen and pound sterling were offset to a degree by gains against a number of European currencies.

Exchange rates

On balance, the euro has lost ground against the US dollar since the end of the first half of the year. Fading expectations that the Fed would lower policy rates bolstered the US currency in mid-August 2019. Market participants were still expecting another rate cut by the Fed in September, but their reading of the minutes from the FOMC's most recent meeting was that later policy rate cuts had become less likely. Fed Chair Jerome Powell's widely regarded speech in Jackson Hole likewise contained none of the hints that some market players had been hoping for that a protracted cycle of rate cuts was in the offing. In the euro area, meanwhile, some members of the ECB's Governing Council were explicitly calling for an extensive easing of monetary policy in the Eurosystem, which weighed on the euro. The announcement of stronger-than-expected declines in German GDP growth for the second quarter and in the Ifo business climate index provided further headwinds for the single currency. Towards the end of August, political uncertainty in Italy, triggered by the collapse of the country's coalition government, sent the euro lower still.

In September, the euro fluctuated within a relatively narrow range of between US\$1.09 and US\$1.11, without any clearly discernible trend. The package of measures adopted by the ECB Governing Council to loosen monetary policy did not have a lasting effect on exchange rate developments. But following publication of lower-than-expected German inflation numbers, the euro slipped to just under US\$1.09 as the month drew to a close, the lowest it has been since May 2017. Sentiment turned in the euro's favour in early October as a raft of surprisingly weak US economic data were released. After that, growing hopes that the United Kingdom and European Union might be able to agree on the UK's orderly withdrawal

Euro down against the US dollar, ...

Deutsche Bundesbank

from the EU shored up the euro, including against the US dollar. While the policy rate cut agreed at the FOMC's October meeting had been widely expected by markets, the Fed's indication that it would be pausing its monetary easing campaign put the euro under pressure for a time. As this report went to press, the euro was trading at US\$1.10, 3.4% down on its level at the end of June 2019.

The euro depreciated against the yen in the second half of August, propelled by largely the same factors on the European side as those driving the single currency's performance against the US dollar. In addition, as a result of

an easing of the trade dispute between the United States and China, global risk aversion among market participants fell in the second week of September. Declines in global risk aversion tend to trigger net capital outflows out of Japan, weakening the country's currency. This backdrop helped the euro to bounce back distinctly against the yen. The single currency did lose ground against the yen for a time during the second half of the month, when the Bank of Japan (unlike the ECB and Fed before it) decided not to loosen its monetary policy stance any further. But in October, hopes of an orderly Brexit sent the euro higher again, just as they boosted the single currency's performance against the US dollar. As this report went to press, the euro stood at ¥119, which was 2.5% lower than at the end of the second quarter.

The euro's movements against the pound ster-

ling during the reporting period were largely determined by how likely different market players saw the prospect of the United Kingdom leaving the EU without a deal at the end of October. Peaking at a two-year high of £0.92 in mid-August, the euro fell back significantly until the middle of September, when the risk of a no-deal Brexit declined noticeably after the UK government lost its parliamentary majority, an early general election was rejected, and legislation preventing such a disorderly Brexit was passed. In addition, better-than-expected retail sales and GDP numbers were reported in the UK. A brief countermovement ensued when debate over a disorderly Brexit flared up in the House of Commons, spooking markets again that the United Kingdom was set to withdraw from the EU without a deal on 31 October. Against the odds, though, fresh hopes emerged on 10 October that UK and EU negotiators might yet be able to hammer out a new withdrawal agreement at short notice. Within the space of a day, this news wiped 2.9% off the euro's value (in terms of euro reference exchange rates), the heaviest single-day

loss the single currency had ever sustained

against the pound sterling. As it became in-

... and particularly against the pound sterling

... the Japanese yen, ... creasingly clear during the following week that the EU and the UK would indeed strike a deal, the euro continued to depreciate against the UK currency. Calm returned to the EUR/GBP exchange rate when the UK's withdrawal from the European Union was postponed once again. At the close of the reporting period, the euro was trading at £0.86, which was around 4.5% lower than at the end of June.

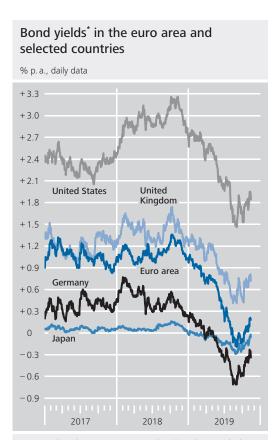

Euro weaker in effective terms as well

Measured as a weighted average against the currencies of 19 major trading partners, the euro has lost 1.6% of its value overall since the beginning of the third quarter. Considering the euro's disproportionately heavy losses against the US dollar, yen and pound sterling, this was a relatively moderate decline in effective terms, thanks in part to the single currency's gains against the Polish zloty (+1%), Swedish krona (+1.2%) and Norwegian krone (+4.4%). Indeed, the euro briefly reached an all-time high against the latter Scandinavian currency. The real effective euro exchange rate - i.e. after taking into account the inflation differentials between the euro area and its major trading partners – likewise declined somewhat during the period under review. Making allowances for estimation uncertainty, the price competitiveness of euro area suppliers can currently be regarded as neutral.

Securities markets and portfolio investment

Bond market

Yields down on both sides of Atlantic From the end of June 2019, government bond yields largely fell on balance in the major currency areas. In the United States, yields on tenyear US Treasuries retreated by 19 basis points to 1.8%, mainly because of lower term premia calculated from yield curve models. This might be indicative of reduced investor uncertainty over the future path of interest rates, after the Fed lowered the target corridor for the Federal Funds Rate as expected in multiple steps. On the other hand, estimates suggest that market

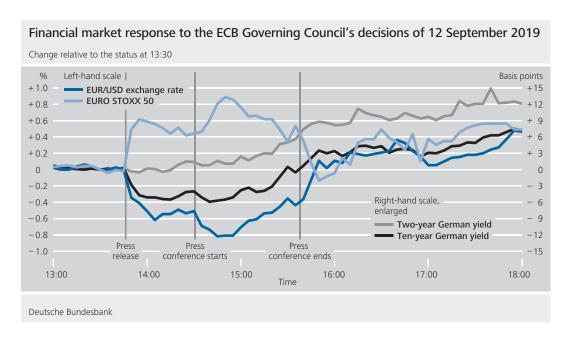

Source: Bloomberg. * Government bonds with a residual maturity of ten years.

Deutsche Bundesbank

expectations for short-term rates on average for the next ten years picked up slightly. The Fed noted at its meeting in late October that the latest cut in rates provides some insurance against ongoing risks, adding that it considers the current monetary policy stance appropriate and presently sees no need for any further cuts as long as economic conditions do not change substantially. In light of this, the fed funds futures market placed a low probability on another interest rate move before the end of this year.

The yield on ten-year Federal bonds (Bunds) has fallen slightly amid substantial volatility since the end of June, closing the reporting period 2 basis points lower overall at -0.35%. Already back in negative territory since March, ten-year Bund yields continued to trend downwards in the third quarter, reaching a new all-time low of -0.75% in September. This decline was probably fuelled primarily by concerns that economic activity might weaken further and

10-year Bund yield slightly lower on balance

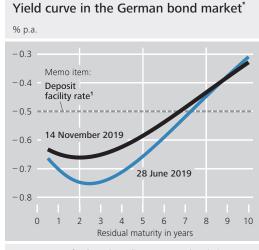

that the trade conflict between the United States and China could flare up. Market expectations of a fresh round of monetary policy easing by the Eurosystem are also likely to have been behind the drop in yields. At its September meeting, the ECB Governing Council did indeed adopt a package of measures which include a 10-basis-point cut in the deposit facility rate as well as the resumption of net asset purchases as part of the expanded asset purchase programme (APP) at a monthly pace of €20 billion as from 1 November. This decision immediately sent ten-year Bund yields lower as the day progressed and higher again after that. Evi-

dently, some market players had been expecting the policy decisions to be more expansionary still. Starting in mid-October, yields on tenyear Bunds increased again quite substantially, mainly in response to signs that the trade conflict was easing and the decisions surrounding Brexit. On balance, the yield spread between ten-year US Treasuries and their German counterparts narrowed by 17 basis points to 218 basis points.

As this report went to press, the term structure computed from yields on Federal securities was flatter than at the end of the second quarter. The spread between ten-year and two-year yields came to 33 basis points in mid-November, meaning that the term structure was flatter for a time than it had been for more than a decade. Bonds with residual maturities of three years and more all touched record lows during the reporting period, with yields on 30-year Federal bonds also drifting into negative territory for the first time ever. Lower term premia also had a bearing on yield developments in Germany. Market uncertainty surrounding the future path of interest rates appears to have abated in the wake of September's monetary policy decisions. The implicit short-term interest rate expectations contained in the Bund term structure for the average of the next ten years, on the other hand, have increased slightly since

German yield curve still very flat

Deutsche Bundesbank

the end of June, suggesting that some market participants had been expecting a higher degree of accommodation.

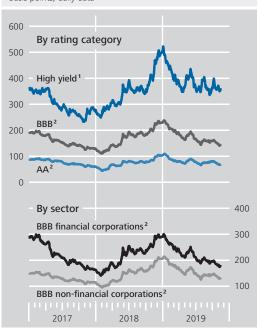

Yield spreads over Bunds down sharply The yield spread between ten-year Bunds and ten-year government bonds of other euro area countries (GDP-weighted average) narrowed distinctly compared to the end of June (down 20 basis points at 73 basis points). Spreads tightened particularly sharply for ten-year bonds from Greece and Italy, whose premia over ten-year German paper both declined by more than 70 basis points in the period under review. There are probably two reasons for this. The first is fiscal developments in both countries. Italy's draft budget assuaged fears by not aiming to increase the deficit ratio. Greece, meanwhile, benefited from higher-thanexpected tax revenue and an upgrade in its sovereign rating by one rating agency. The second reason is that both countries are likely to have been attractive to investors in search of yield, given that the interest on less risky bonds of other euro area countries is low.

Yields down in the UK, up in Japan Compared to the end of June, yields on tenyear UK bonds (gilts) were down by 12 basis points at 0.7%. The Bank of England left its monetary policy stance on hold at its September meeting and also stressed that a rate cut in the near future had become more likely, citing the uncertainty surrounding Brexit as well as the trade dispute between China and the United States. In Japan, meanwhile, ten-year government bonds were yielding -0.1% at last count, 10 basis points more than at the end of June. Yields thus remained within the broader corridor specified by the Bank of Japan as part of its yield curve control programme. At its meeting at the end of October, it expanded its monetary policy outlook to include the possibility of an interest rate cut, thereby adjusting its forward guidance slightly.

Five-year forward inflation rates five years ahead for the euro area came to 1.2% as this report went to press. However, the period under review saw market expectations for for-

Deutsche Bundesbank

ward inflation rates fluctuate quite strongly, which will have been mainly due to shifting outlooks for the economy and expectations of monetary policy easing. In early October, the five-year forward inflation rate briefly touched a new all-time low of 1.1%. However, this indicator gives a distorted view of the level of long-term inflation expectations, since it currently also includes negative liquidity and inflation risk premia. These risk premia are the reason for the gap between market-based indicators and the higher inflation expectations computed from surveys. Long-term euro area inflation expectations collated by Consensus Economics, on the other hand, rose slightly to 1.9%.

forward inflation rate down, survey-based inflation expectations up slightly

Euro area

Yields on European corporate bonds declined further during the period under review. Bonds issued by BBB-rated financial corporations with a residual maturity of between seven and ten years were yielding 1.4% as this report went to press, 30 basis points less than at the end of June. Yields on non-financial corporate bonds

of equivalent maturity fell by 15 basis points to 0.9%. With risk-free interest rates only marginally lower, corporate bond spreads over Bunds tightened on roughly the same scale, leaving them far below their respective five-year averages at last count. Furthermore, as spreads receded, so, too, did CDS spreads and equity market uncertainty. Altogether, this can be read as suggesting that market participants' risk aversion has eased overall.

Net issuance in the hond market Gross issuance in the German bond market stood at €356 billion in the third guarter of 2019 and was therefore above its previousquarter level (€324 billion). After deducting redemptions and taking account of changes in issuers' holdings of their own bonds, net issuance of bonds came to €18½ billion. Moreover, foreign borrowers placed debt securities worth €11 billion in the German market. The outstanding volume of debt instruments in the German market therefore rose by €29 billion in the period under review.

The public sector issued bonds totalling €16 billion net in the July to September period. This figure also includes issues by resolution agencies set up for German banks, which are ascribed to the public sector for statistical purposes. In the quarter under review, state governments in particular issued their own bonds on balance, to the value of €11½ billion. The Federal Government itself primarily issued fiveyear Federal notes (Bobls; €11 billion), but also issued 30-year Federal bonds (Bunds; €4 billion) and Treasury discount paper (Bubills; €3 billion). This contrasted with net redemptions of ten-year Bunds totalling €11 billion.

Net issuance of

corporate bonds

Rise in public

sector capital

market debt

In the guarter under review, domestic enterprises issued debt securities worth a net €5½ billion, following strong net issuance amounting to €15 billion in the previous quarter. Nonfinancial corporations were the primary issuers here and placed almost exclusively long-term securities in the market on balance.

> Net redemptions bv credit institutions

Domestic credit institutions reduced their capital market debt by €3½ billion between July and September, following net issuance of €11 billion in the previous quarter. The focus of their redemption activity lay on other bank debt securities that can be structured flexibly and mortgage Pfandbriefe (€4½ billion and €1½ billion, respectively). Specialised credit institutions, meanwhile, issued debt securities totalling €1½ billion net.

the main buyers in the domestic bond market, adding paper worth a net €16½ billion to their portfolios. Domestic securities issued by the public sector were the focus of buyer interest. Domestic credit institutions increased their bond holdings by €10½ billion, acquiring exclusively foreign bonds on balance. Non-resident investors added German debt securities totalling €5½ billion net to their portfolios. On balance, this was almost all in the form of securities issued by the private sector. The Bundesbank was alone in scaling back its portfolio,

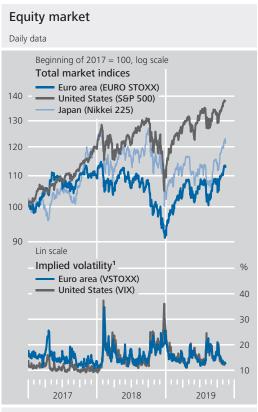

shedding €3 billion for operational reasons.

In the third quarter, German non-banks were Domestic nonbanks and credit institutions main buyers of debt securities

Equity market

Stock markets benefited from looser monetary policy and receding political uncertainty There was a significant increase in equity prices worldwide in the period under review. On balance, the US S&P500 saw a 5.3% rise on its end-June level. At 8.8%, the climb recorded by the Japanese Nikkei was even more substantial, though still failed to compensate for the first half of the year's poorer performance in comparison to the other major international indices. The European EURO STOXX rose by 5.8%; Germany's CDAX recorded a slightly higher increase of 6.0%. By contrast, the UK equity market saw significantly weaker performance, with the FTSE All-Share index recording a slight loss of 0.9%. Equity prices were boosted by the accommodative monetary policy on both sides of the Atlantic.1 However, the economic impulses observed in the markets over the period under review did not add up to a clear picture on either side of the Atlantic. Most recently, prices were being bolstered by the positive start to the US budget season as well as a better than expected US labour market report. Further tailwinds came from signals of a more relaxed situation with respect to the trade conflict between the United States and China and in terms of Brexit. The lower equity risk premia for the S&P500 and the EURO STOXX, as determined using a dividend discount model, reflected this reduced degree of political uncertainty that pushed up equity prices. In the models, a greater appetite for risk on the part of investors and the falling interest rate level over the course of the period under review more than made up for the downward revision of profit expectations. This meant a rise in the calculated valuation levels, though these are still close to their five-year averages both in the case of the S&P500 and the EURO STOXX.

Varying performance for bank shares On the back of strong quarterly results, bank shares in the United States rose by a considerable 11.2%. European bank shares also outperformed the European market as a whole (+5.6%). Stock in UK banks, meanwhile, experienced a significant fall in value during the period under review (-5.7%). A key factor here

Sources: Thomson Reuters and Bundesbank calculations. 1 Calculated using the prices of index options. For the euro area, calculated using options on the EURO STOXX 50.

Deutsche Bundesbank

is likely to have been the negative impact on the UK financial industry of the country's impending withdrawal from the EU, which remains hard to gauge at this point.

Market participants' uncertainty concerning future price developments – as measured by the implied volatility of equity indices calculated on the basis of options – had initially surged at the end of July when the trade conflict between the United States and China temporarily intensified. It subsequently receded on a continuous basis, and at the end of the period under review was back at the low levels seen before the aforementioned rise. This meant that it lay well below the five-year averages overall.

Volatility at a low level of late

¹ In response to the press release concerning the ECB Governing Council's monetary policy decisions on 12 September 2019, the EURO STOXX 50 posted immediate gains; these cooled somewhat once the press conference was over. By 18:00, the price effect amounted to +0.5% (see the chart on p. 40).

Deutsche Bundesbank

Domestic enterprises issued €½ billion worth of new shares in the third quarter of 2019, the majority of which were unlisted securities. The volume of foreign equities outstanding in the German market rose by €7½ billion. On balance, equities were acquired predominantly by domestic non-banks (€10 billion). Foreign investors purchased equities for €1 billion in net terms, while domestic credit institutions scaled back their equity holdings by €3½ billion.

Equity issuance and acquisition

Investment funds

During the quarter under review, domestic investment companies recorded inflows of €25 billion, after raising funds totalling €17½ billion in the previous three-month period. The fresh funds mainly accrued to specialised funds reserved for institutional investors (€20½ billion). Among the various asset classes, mixed securities funds, in particular, attracted large inflows (€15 billion). Open-end real estate funds and funds of funds also placed new shares in the market (€5 billion and €21/2 billion, respectively). Foreign funds operating in the German market attracted inflows totalling €11 billion net in the third quarter. Domestic non-banks were the main buyers, adding mutual fund shares worth €35 billion to their portfolios. Their focus was predominantly on German paper. Domestic credit institutions purchased mutual fund shares worth a net €2 billion, while foreign investors scaled back their investment in German funds by a net €1 billion.

Sales and purchases of mutual fund shares

Direct investment

While transactions in cross-border portfolio investment in the third quarter of 2019 resulted in net capital exports of €15½ billion, direct investment brought inflows of €6½ billion on balance.

Direct investment sees capital imports

In the period from July to September 2019, foreign direct investment in Germany came to a net €31 billion, compared to €26½ billion in Germany

Rise in inward direct investment in

the previous quarter. At €25½ billion, most of this was in the form of intra-group loans, with funds predominantly being provided as financial credits, on balance. Almost half of these constituted reverse investments, whereby foreign affiliates grant credits to their German parent companies. This is a typical way for them to pass on proceeds from securities issuance. Foreign enterprises increased their equity capital in Germany by €6 billion in the third quarter, mainly through reinvested earnings. The third quarter saw comparably high inward FDI flows coming from Luxembourg (€10½ billion), the United Kingdom (€9½ billion) and the United States (€5½ billion), in particular.

Firms domiciled in Germany increased their direct investment abroad by €24½ billion between July and September (compared with Capital outflows €30½ billion in the previous quarter). They primarily boosted their equity capital abroad (€22½ billion), the lion's share of which was accounted for by reinvested earnings. Furthermore, they also granted more loans to affiliated enterprises abroad on balance (€2½ billion). This lending came in the shape of financial credits, while there was a reduction in the volume of trade credits. German enterprises invested in a number of countries and regions throughout the world. The period from July to September 2019 saw particularly high levels of investment in the United States and Luxembourg (at roughly €5½ billion in each case) as well as the United Kingdom (€4½ billion), Switzerland (€3 billion) and Sweden (€2½ billion).

The German economy

Macroeconomic situation

German economic output saw a marginal increase in the third quarter of 2019. According to the Federal Statistical Office's flash estimate, real gross domestic product (GDP) was up by 0.1% on the guarter after seasonal and calendar adjustment. The underlying cyclical trend remained weak. This was again due mainly to the ongoing downturn in the export-oriented industrial sector. Meanwhile, the domestically oriented sectors continued to provide a certain amount of impetus, helped by the still favourable income outlook for employees. Although the cyclical slowdown is gradually becoming noticeable in the labour market, it has shown itself to be fairly robust on the whole. Leading economic indicators for industry are also showing the first tentative signs that the downward trend in this sector might be decelerating. This

Deutsche Bundesbank

would reduce the risk of the downturn spreading to the domestic sectors on a larger scale.¹

Looking at the individual economic sectors, the German economy continued to present a split picture in the third quarter. Declining manufacturing activity was the main reason for the fact that there was next to no growth in GDP. There is likely to have been a rise in construction output, however. Value added in the businessrelated services sectors (excluding trade) is also likely to have been somewhat up on its level of the preceding quarter. Trade provided a clearly positive stimulus. This was not just down to buoyant activity in the retail sector; turnover in the wholesale trade also saw a distinct rise despite sluggish business in industry. On the demand side, it was chiefly higher private and government consumption expenditure that boosted aggregate output. Exports likewise showed a marked rise again compared with the weak preceding quarter. This is noteworthy because export activity and industrial output usually move fairly closely in parallel. By contrast, private investment in machinery and equipment is unlikely to have changed much. Overall capacity utilisation underwent a further decrease and drew closer to the normal level of utilisation.

sion in German firms' exports in price-adjusted terms, with exports of goods to euro area and non-euro area countries growing on the same scale. The positive stimuli from non-euro area countries were fairly unevenly distributed across regions in terms of value. Exports to the United Kingdom, for example, rose strongly. This was probably only partly due to exports

The third quarter of 2019 saw a distinct expan-

This was probably only partly due to exports returning to normal after the weak second quarter. A large part of the increase was down to the surge in exports of precious metals. This could be because of London's role as a key

Divergence in economic activity continues

Distinct rise in exports

trading centre for such goods. German exporters also enjoyed brisk sales to Switzerland and the OPEC countries. Business with China and the newly industrialised Asian economies contracted heavily, however. The value of exports to the South-East Asian emerging markets, to Russia and to Japan fell even more sharply. Broken down by category of goods, only real exports of capital goods underwent a marked decline according to the data available up to August, whereas exports of intermediate and consumer goods showed a distinct increase.

Probably little change in commercial machinery and equipment

Investment in commercial machinery and equipment is likely to have seen little change in the third quarter of 2019. Utilisation of production capacity in industry decreased further as the protracted bout of weakness in the industrial sector continued. This is likely to have dampened enterprises' willingness to invest. The value of domestic sales by German manufacturers of capital goods was no higher than its level in the previous quarter. The value of imported capital goods continued to show a slight decrease in fact. However, the steep increase in new passenger car registrations for businesses probably gave a considerable boost to investment activity in the reporting period. This is true even taking into consideration the fact that a significant number of these new registrations were probably one-day registrations. This is presumably due to the updated vehicles test procedure designed to limit evaporative emissions (EVAP amendment) valid since September 2019. Before the new standard entered into force, motor vehicle dealers probably undertook a greater number of oneday registrations for businesses so that they could later sell the brand new vehicles to private owners under the old regulation. Some of these vehicles have presumably since been resold as used cars. Nevertheless, one sign of a waning propensity to invest is provided by new registrations of commercial vehicles, which experienced an interruption in their steep upward trend of recent quarters and underwent a quite substantial decline.

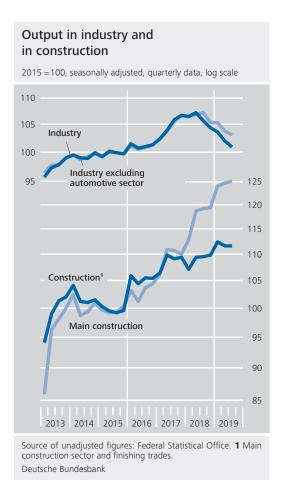

Foreign trade Seasonally adjusted, quarterly data 2015 = 100, log scale Exports of goods Price adjusted¹ 100 Total 90 to non-euro area 110 countries 100 100 90 120 110 to euro area countries 100 90 Imports of goods Price adjusted 110 100 90 85 € bn Lin scale 80 Foreign trade balance 60 40 20 2013 2014 2015 2016 2017 2018 2019 Source of unadjusted figures: Federal Statistical Office. 1 Adjusted using the price indices for foreign trade. Deutsche Bundesbank

Construction investment rose in the third quarter of 2019, according to the Federal Statistical Office. Figures for turnover in the main construction sector available up to August showed a substantial fall on the quarter, but other economic indicators, such as firms' positive assessment of the situation, suggest that the boom in this sector is continuing unabated.

Private consumption is likely to have expanded significantly in the third quarter of 2019. This is signalled, first and foremost, by real retail sales, which rose markedly on the quarter in the reporting period. Contributing factors are likely to have been exceptionally high wage growth

Construction investment up

Significant growth in private consumption

owing to bonus payments and the low inflation rate. Retailers of electrical household appliances, furniture and furnishings were the main beneficiaries of consumers' major willingness to spend. Online trading and mail order sales also provided impetus. Equally, trade in motor vehicles is likely to have boosted private consumption during the third quarter. Although there was a sharp fall in new passenger car registrations by private owners, the third quarter of 2019 saw an even stronger increase in new registrations by businesses. Some of these vehicles are likely to have been one-day registrations, which car dealers have since sold to households. By contrast, the hotel and restaurant sector had a dampening impact with real sales continuing their downward path from the previous quarter, after having risen strongly in the fourth quarter of 2018 and first quarter of 2019.

German imports as defined in the national accounts remained at roughly the same level

as the preceding quarter, according to data from the Federal Statistical Office. Based on the definition in the foreign trade statistics, on the other hand, there was a distinct increase in price-adjusted imports of goods in the third quarter of 2019. However, significantly lower energy prices resulted in a marked decline in nominal terms. The figures available up to August show a strong decline in energy imports at current prices, although they increased quite substantially in real terms. Price-adjusted imports of intermediate and capital goods decreased, remaining on their downward trajectory of the preceding quarter amidst ongoing weakness in the industrial sector. Imports of consumer goods remained stable, however. Broken down by region, there was a significant decrease in imports from euro area countries, but an equally marked increase in imports from non-euro area countries, which have a higher weighting. In this instance, however, it was, above all, the value of trade with the United Kingdom that provided positive impetus, which is due in all probability to exceptional developments in connection with the ongoing controversy over Brexit. Much like exports to the United Kingdom, imports experienced a slump in the second quarter. They have latterly returned to normal levels.

in imports of goods

Little change

Sectoral trends

The downturn in the industrial sector continued in the third quarter of 2019. In quarter-on-quarter terms, there was a major drop in industrial output, which means that it contracted for the fifth time in a row. The strongest decline was in intermediate goods output, with manufacturers of electrical equipment and chemical products being hit hardest by severe cutbacks in production. Manufacturing of consumer goods also failed to match the previous quarter's level by a large margin, whereas production of capital goods was down only slightly. The main dampening effect in this area stemmed from the automotive sector, where production fell sharply in the reporting period.

Industrial output still declining

Weak global demand and shifts in production to neighbouring countries long taking toll on automotive production This represents a continuation of the pattern whereby production shortfalls in the automotive sector are more pronounced than in other sectors in the current industrial downturn. One logical explanation for this is the fact that global demand for motor vehicles is especially weak. Global sales of passenger cars have witnessed a drop of 61/2% since the fourth quarter of 2017, when the upturn had reached its peak.2 But this fact alone fails to explain the decline in the number of passenger cars manufactured in Germany, which – at just over 17% after seasonal adjustment – was much greater according to data from the German Association of the Automotive Industry (VDA). Rather, it appears that there have also been instances of production being shifted from Germany, mainly to other EU countries. According to VDA data, passenger car production in Germany by German carmakers fell by more than 9% in 2018. By contrast, production by these manufacturers in other EU countries increased by more than 8%. The reasons for this development are not entirely clear. It is possible that product range effects have played a part in production being relocated, meaning that passenger car models of German corporate brands that are manufactured abroad could have been in greater demand recently than the models made in Germany. It is also conceivable that factories in Germany have been increasingly refitted and retooled for the production of electric cars and that there was a cutback in production during this period. The fact that capacity utilisation was still at a high level in Germany in 2017 has also occasionally been advanced as a possible reason for production being relocated. However, manufacturing was evidently not transferred back to Germany once capacity was freed up again. This suggests that cost considerations may have also been a factor.

Further decline in industrial capacity utilisation Utilisation of available production capacity has declined further against the backdrop of the ongoing industrial downturn. According to ifo Institute data, capacity utilisation of tangible fixed assets in manufacturing was down con-

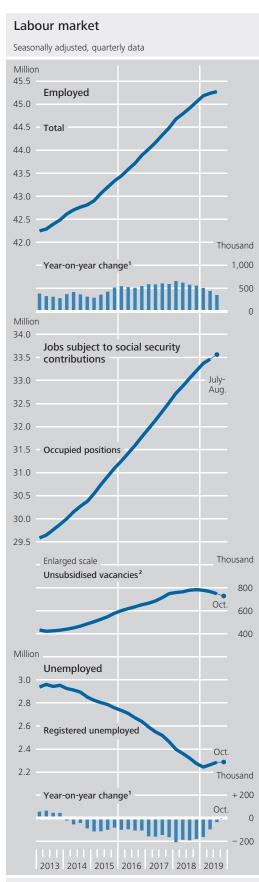

siderably in the third quarter of 2019. It has thus been falling for more than a year now and has meanwhile dropped below its long-term mean. The main reason for the decrease in the third quarter was declining capacity utilisation in the intermediate and capital goods sectors. Producers of consumer goods, on the other hand, reported distinctly higher utilisation of their production capacity.

Construction sector output remained stable in the third quarter of 2019. Activity in the main construction sector rose slightly, with the expansion in building construction being marginally greater than that in civil engineering projects. Construction activity in the finishing trades, by contrast, declined somewhat. Despite the sideways movement shown by the output index, the sector's real gross value added could have increased overall. The sector is still in the midst of a boom. This is signalled, amongst other things, by healthy sentiment and order books as well as construction permits, which have increased steeply since the start of the year.

Construction output virtually unchanged, but value added probably greater

Economic activity in the services sectors is likely to have expanded slightly in the third quarter of 2019. There was a marked expansion in price-adjusted retail sales. Sales were also on an upward path in the wholesale trade, despite industry remaining weak. Taking the average of July and August – the months for which the latest statistical data are available - real wholesale sales rose markedly on their second-quarter level. Developments in turnover in the hotel and restaurant sector had a dampening effect, however. Car dealers reported strong sales growth in July and August compared with the previous quarter. However, it is likely that this was connected with a considerable increase in the number of one-day registrations before emissions standards were tightened from September 2019. A significant rebound effect is therefore expected in September. Growth in business activity in the other services sectors is

Slight growth in services sectors likely

Sources of unadjusted figures: Federal Statistical Office and Federal Employment Agency. **1** Not seasonally adjusted. **2** Excluding seasonal jobs and jobs located abroad.

Deutsche Bundesbank

likely to have been muted. This is suggested by the assessment of the business situation in this sector, which, according to the ifo Institute, showed a distinct deterioration in the third quarter.

Labour market

The marked slowdown in the economy is gradually affecting the labour market. Nonetheless, the labour market still appeared fairly robust in the third quarter. Employment continued to rise, albeit at a considerably slower pace than last year. There was no further fall in unemployment; rather, it stagnated at a level that was exceptionally low compared with other periods. There was no more than a slight increase in short-time work for economic reasons. However, there has been a further deterioration in the labour market outlook for the next few months.

Impact of downturn on labour market limited so far

Employment expanded in the third quarter of 2019 as well, but only marginally. The seasonally adjusted number of persons in work in Germany rose by 37,000, or 0.1%, in the reporting quarter. Much like before, the positive employment balance is attributable to employment subject to social security contributions, while there is an ongoing decline mainly in the number of self-employed persons and people working exclusively in low-paid part-time jobs.

Little growth in employment in Q3

The monthly statistics on employment subject to social security contributions, which currently run up to August 2019, show slight increases in most sectors of the economy. Overall, the Federal Employment Agency's initial estimate shows that, taking the average of the months of July and August, the number of persons in employment subject to social security contributions was 78,000 persons, or 0.2%, higher than the average of the second quarter. Employment was in steep decline solely in the temporary employment sector, with a fall of one-eighth within the past 12 months. Many temporary workers are employed in manufac-

Decline in employment mainly for temporary workers, growth in many services subsectors

turing, which is suffering most from weak exports. However, the number of workers directly employed in manufacturing and subject to social security contributions remained largely unchanged at the end of the period under review. Most enterprises in this sector are probably trying to retain their core staff. This stands in contrast to a number of sectors where major recruitment drives are continuing as before, reflecting the ongoing two-speed development of the economy. Notable examples are, above all, the structurally growing IT sector, as well as personal services such as education, in addition to restaurants and hotels, the public sector and healthcare and social work. In the last-named case, the labour supply is likely to be still restricting employment growth. Employment in business-related services (excluding temporary agency employment) at the end of the period under review was growing less strongly than before. In the construction sector, too, growth is no more than average.

Growth in labour demand flagging, while increase in labour supply only muted

Compared with the same month last year, the number of persons in employment subject to social security contributions rose by just 489,000 due to the less expansive recruitment policies of enterprises at present. At the same time, the number of German nationals in employment is growing at an ever slower pace for demographic reasons, which meant that they were able to take up only around 40% of the additionally created jobs. The other 60% were taken up by nationals of other countries. However, immigration from other EU countries, in particular, has eased off considerably during the course of the year so far.3 In those economic sectors especially hit by a shortage of labour, the shortfalls have barely been reduced as yet despite the cooling of the economy.

Unemployment unchanged The fact that there was hardly any change in seasonally adjusted registered unemployment in recent months is consistent with this picture. On an average of the third quarter, 22,000 more people were registered as unemployed than in the preceding quarter. This comparison partly reflects the fact that the unemployment

figure for persons receiving the basic welfare allowance was revised upwards in May, however. The figure shown for April is still too low. From May up to and including October, registered unemployment fluctuated only slightly between 2.28 and 2.29 million persons. The unemployment rate remained unchanged at 5.0% during this period. Nevertheless, the economic downturn was clearly reflected in the unemployment insurance scheme, where the number of unemployed persons rose by more than 30,000 over the last five months. By contrast, the number of unemployed receiving the basic welfare allowance declined by virtually the same amount.

In addition to registered unemployment, total underemployment (excluding short-time work) has also been constant since May. Active labour market policy measures were neither expanded significantly nor reduced. By contrast, shorttime work for economic reasons rose from a low level. Short-time work for economic reasons has to be reported to the Federal Employment Agency (BA) before normal working hours can be reduced. The number of such reports can therefore provide information about developments in the next few months. There was a significant rise in the number in September after the end of the summer holidays. For this reason, the Federal Employment Agency expects the number of persons in short-time working arrangements to rise to around 80,000 persons in November, but even this would still be on a moderate scale.

The leading labour market indicators mostly showed a further deterioration during the past few months. This is true of employment indicators such as the labour market barometer of the Institute for Employment Research (IAB) and the Federal Employment Agency's BA-X job index. Even so, they suggest that there will be

short-time work likely in near future

Increase in

Continuing deterioration in leading indicators in most cases

³ According to the Federal Statistical Office's migration statistics, Germany's migration balance with the other EU countries amounted to just +78,000 persons in the period from January to July 2019. This is 43% lower than the figure for the same period of 2018.

Sources: Federal Statistical Office (actual earnings) and Deutsche Bundesbank (negotiated rates of pay). 1 The wage drift is calculated as the annual change in the ratio of actual earnings to negotiated rates of pay.

Deutsche Bundesbank

a muted upward movement in employment in the fourth quarter. There was a marked decrease in the number of reported vacancies. In this context, the above-mentioned two-speed sectoral growth is likely to continue for the time being. More than half of the decline was due to the other business-related services sector, which is shaped by developments in temporary employment. There was also a decrease in the number of vacancies in the sectors of manufacturing, logistics, and freelance, scientific and technical services. This contrasted with vacancies in IT and personal services, which remained stable or even saw an increase. This split development across sectors is also confirmed by the Ifo employment barometer, which stabilised overall towards the end of the period under review after undergoing several strong declines. The outlook in the manufacturing sector was predominantly pessimistic. On the other hand, positive plans for employment continue to dominate in the services sectors (except in "neutral" trade) and in construction. The leading indicator for unemployment in the IAB labour market barometer is still in slightly negative territory. Unemployment could go up somewhat over the next three months.

Wages and prices

The third quarter saw an exceptionally strong increase in negotiated pay rates. Including additional benefits, rates of pay went up by 4.2% on the year in the third quarter of 2019, compared with a 2.1% increase in the previous quarter. This, for a time, considerably higher rate of growth was mainly due to new special payments in the metal-working and electrical engineering industries, which had already been agreed last year.⁴ The fixed amount of €400 and the negotiated additional sum amounting to 27.54% of one monthly wage were due for the first time in July 2019.

Sharp rise in negotiated pay rates due to one-off effects

The increase in negotiated rates of basic pay - in which these special payments are not included - was less marked. However, at an annual rate of 2.4%, they, too, showed a somewhat stronger rise in the third quarter than in the relatively weak second quarter. As in the previous quarter, the services sectors were the key driver in this respect. The weaker rates of growth in negotiated basic pay in the production sector, including construction, were largely due to an accumulation of months with pay freezes resulting from the previous year's collective wage agreements. One factor in play here was that regular increases in the negotiated rates of basic pay had been substituted by special payments in some cases. By contrast, the economic downturn in industry was not yet particularly evident. In the third quarter, actual earnings are still likely to have risen more strongly than on an average of the past ten

Basic pay also pointing upwards

⁴ Special payments are recorded as additional benefits in the Bundesbank's negotiated pay rate statistics.

2019 wage round drawing to a close The wage demands for the outstanding negotiations of this year's wage round range between 5.5% and 8.5% over a 12-month period, which means that the demands are mostly higher than those of the last wage round for the same sectors. Wage negotiations are currently under way in the chemical industry, the wood and plastics processing industry, insurance and temporary employment. Besides higher wages, trade unions are demanding new contractual elements such as individual future working time accounts (to take time off work for several months or to take care of relatives, for instance) and additional long-term care insurance financed by the employer.

One-off statistical effect temporarily dampened consumer price inflation in third quarter

Consumer prices increased moderately in the third quarter. The Harmonised Index of Consumer Prices (HICP) rose by 0.3% in seasonally adjusted terms. Prices for energy had a particularly dampening impact on the back of distinctly lower crude oil prices. By contrast, food prices increased substantially, thus continuing their upward movement, which has been persisting for some time now; this was especially the case for meat and fish towards the end of the period under review. Services also continued to become more expensive, albeit only slightly. The travel market, where prices often fluctuate quite heavily, was a source of dampening impulses. The cost of air travel went up by roughly the same amount as the prices of package holidays went down. However, as package holidays account for a larger share of the basket of goods, their decline had a greater impact. The prices of industrial goods, excluding energy, were up slightly, in line with the development of industrial producer and import prices. Despite this, annual headline HICP inflation declined significantly overall from 1.7% to 1.1%. This was also the case for the rate excluding energy and food, which fell from 1.5% to 0.9%. Above all, this was driven by a statistical effect in prices for package holidays, which is likely to have reduced the headline rate in the third quarter of 2019 by 0.4 percentage point and core inflation by as much as 0.6 percentage point.5

Import, export, producer and consumer prices

2015 = 100, seasonally adjusted, quarterly

Source of unadjusted figures: Federal Statistical Office. 1 Producer price index for industrial products in domestic sales. 2 Harmonised Index of Consumer Prices. 3 Not seasonally adjusted.

Deutsche Bundesbank

Seasonally adjusted consumer prices were unchanged on the month in October. For both energy and non-energy industrial goods, prices remained at roughly the same levels as in the previous month. By contrast, food became markedly cheaper, although prices for services saw a significant rise despite a marked drop in prices for travel. Headline inflation remained at 0.9% overall in year-on-year terms. Excluding energy and food, however, the rate increased

Consumer prices stagnant in October

⁵ See Deutsche Bundesbank (2019c). At 1.5%, the headline annual rate of consumer inflation according to the national Consumer Price Index, which is not affected by this one-off effect, was significantly higher on an average of July and September.

Demand for industrial goods and construction services

Volumes, 2015 = 100, seasonally adjusted, quarterly data

Deutsche Bundesbank

marginally from 1.0% to 1.1%, with the statistical effect relating to package holidays now having only a slightly dampening effect. Leaving aside not only energy and food but also the equally volatile price components of travel services and clothing, the rate of inflation, at 1.5%, still stood at a heightened level.

HICP inflation is likely to exceed the 1% mark again in the coming months. Moreover, in November the statistical effect in the case of package holidays will no longer have a dampening effect on prices, but will push them up, before running its course in December.

Inflation likely to be above 1% again in coming months

Order books and outlook

The slowdown in the German economy will probably continue in the fourth quarter of 2019 but is unlikely to intensify significantly. As things stand, overall economic output could more or less stagnate. The economy would thus largely be stalling on the whole in the second half of this year, too. However, from today's vantage point, there is no reason to fear that Germany will slide into recession. On the contrary, leading economic indicators for industry are showing the first tentative signs that the downturn in this economic sector could decelerate. According to the Ifo Institute, business expectations in the manufacturing sector were becoming somewhat brighter towards the end of the period under review. There was also only a slight deterioration in industrial enterprises' order situation in the third quarter. The underlying trend in terms of incoming orders has, in fact, remained constant for several months, albeit at a low level. Export-oriented industry could therefore stabilise before the more domestically-oriented sectors are affected to a greater degree. Domestic economic activity will probably continue to provide momentum. Due to its high level of capacity utilisation, no strong rates of growth in output are to be expected in the booming construction sector. However, because the labour market is likely to remain fairly robust and wages are expected to grow con-

economy could stagnate at the end of the year siderably, the outlook for households' incomes should remain favourable. It is therefore to be assumed that private consumption demand will bolster economic activity in the current quarter as well.

Sentiment among enterprises stabilising

There has been no further deterioration in sentiment in the German economy recently. According to the autumn survey of the Association of German Chambers of Commerce, sentiment worsened again significantly compared with the survey of early summer, but according to the Ifo Institute, the Business Climate Index for Germany remained unchanged in October, after, in fact, increasing slightly in the previous month. The fairly widespread improvement in business expectations was the main reason for the recent stabilisation. Enterprises in the hardhit manufacturing sector also looked to the future with more confidence. However, there was a further downgrading in the assessment of the current business situation in most sectors. In terms of the level, the split development in the German economy remained particularly pronounced. While industrial enterprises are already assessing their business situation as considerably weaker than on a longer-term average, enterprises in the retail and construction sectors still judged it as very good from a historical perspective.

Deterioration in orders not as strong as before

Although the third quarter also saw a marked quarter-on-quarter decline in new orders for German industry, industrial enterprises' order situation did not deteriorate as strongly as it had done at the beginning of the year. Disregarding large orders, which are generally received on an irregular basis, the quarter-onquarter decline in new orders slowed down considerably. There are even signs of a stabilisation since May, albeit at a depressed level. Broken down by region, demand from the euro area provided momentum in the third quarter. By contrast, significantly fewer domestic orders were received in guarter-on-quarter terms. New orders from non-euro area countries fell steeply in fact but this was mainly due to a lack of large orders. With regard to sectors, a considerable increase in demand was reported in mechanical engineering. Manufacturers of computer, electronic and optical products also experienced significant growth in new orders. In the other transport equipment sector, there was even a strong increase in the inflow of orders. Overall, however, producers of capital goods had to cope with a significant drop in demand. This was attributable to weak incoming orders in the automotive industry. According to Ifo Institute data, the assessment of order books in the manufacturing sector indicates that the demand situation for German industrial firms may even have eased marginally of late. Towards the end of the period under review, it showed a marked improvement for the first time in a long while, albeit from a low level.

The boom in the German construction sector is likely to continue in the final quarter of 2019 as well. However, this industry is probably still operating close to full capacity. A steep rise in construction output is therefore not to be expected at the end of the year either. Widelyused economic indicators have, for some time now, been tending to move sideways fairly uniformly at a high level. These mainly include the survey variables which the Ifo Institute calculates for the main construction sector: capacity utilisation, the reach of order books, the percentage of construction companies affected by a shortage of skilled labour, and the business climate. By contrast, on an average of July and August – the point in time up to which statistical data are available - orders received by the main construction sector were distinctly down on the guarter in seasonally adjusted terms, which means that the inflow of orders has been in decline since the beginning of the year. This is hardly cause for concern yet, as the decline was from a very high level, which was achieved on the back of a large number of major orders. In the year to date, new orders have still been well up on the average for the previous year.

Capacity utilisation in construction sector remains Private consumption probably still on growth path Household consumption expenditure is set to increase in the final quarter of 2019 as well. The basis for this is the still quite robust labour market. Employment is likely to go on rising slightly and unemployment is expected to show no more than a marginal increase. Wages are likely to rise fairly substantially, which will boost consumers' propensity to buy. This is also evi-

dent in the GfK consumer confidence index, which, despite a number of downgrades, remains at a very high level. This is consistent with the fact that the Ifo Institute's assessment of the business situation in the retail sector was only marginally down on the peak it reached around the middle of the year.

■ Public finances*

■ General government budget

Surplus fairly high again this year ... The German government's finances have remained in good shape this year. The general government surplus is expected to decrease yet remain significant (1.9% of gross domestic product (GDP) in 2018). The debt ratio, i.e. government debt in relation to nominal GDP, declined to 61.2% in the first half of the year (from 61.9% at the end of 2018). Going forward, it is likely to fall rapidly again, undershooting the reference value of 60% by next year at the latest.¹

... but declining, chiefly due to looser fiscal policy Fiscal policy loosening is the chief factor driving down the surplus. It is especially apparent in the marked rise in spending on areas such as pensions and investment. Additionally, the positive cyclical effect is waning. Tax revenue, in particular, is thus seeing somewhat slower growth than in previous years. However, the economic slowdown is putting less of a strain on public finances than a glance at real GDP and the degree of capacity utilisation in isolation might suggest. The reason for this is that wages and salaries, employment and unemployment, and private consumption are developing comparatively favourably. Lower interest expenditure and spending on bank support measures are easing the pressure on public finances. Although payments for Norddeutsche Landesbank (Nord/LB) are expected this year, they will be significantly lower than those for HSH Nordbank last year.

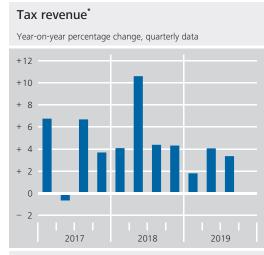

Surplus set to sink further in the coming years It is foreseeable that the surplus will sink further in the next two years. Cyclical developments are once again likely to play a role here in the coming year, with the additional working days having a positive impact (calendar effect). Furthermore, the fiscal policy stance will continue to be eased considerably. For 2020, for example, central government is planning to increase spending on transport and digital infrastructures, education and defence. There are

also indications of continued high expenditure growth for pensions, healthcare and long-term care. On the revenue side, the Bundestag has resolved to partially abolish the solidarity surcharge in 2021. The new climate protection programme will also put a slight burden on the government budget on balance (for more information, see p. 62). Some of the additional revenue generated from CO₂ pricing as from 2021 is to be passed on to households and enterprises as relief to compensate for rising energy costs. Moreover, additional expenditure for the promotion of measures to reduce emissions is already envisaged as of 2020.²

In structural terms, the surplus is likely to decline considerably up to 2021. At the same time, there is still fiscal leeway within the budget rules. This leeway could potentially be used, for instance, to improve the conditions for growth and employment. For example, central government could bring forward the reduction of the solidarity surcharge to the coming year. It still appears appropriate to completely abolish this surcharge in the foreseeable future, possibly embedding it in a more fundamental tax reform.3 State and local governments could reinforce their efforts to improve their educational opportunities and infrastructure. However, such endeavours will probably continue to be restricted by the limited amount of construction projects which are ready to go ahead,

Measures conducive to growth and employment could be accelerated

- * The section entitled "General government budget" relates to data from the national accounts and the Maastricht debt ratio. This is followed by more detailed reporting on budgetary developments (government finance statistics). No data for the third quarter of 2019 are yet available for local government or the statutory health and public long-term care insurance schemes. These will be analysed in the short commentaries in subsequent issues of the Monthly Report.
- 1 The debt ratio is markedly higher overall, according to the latest data revisions. Most notably, nominal GDP was revised downwards.
- **2** At the federal level, the coalition government recently agreed on key points of the announced basic pension and other measures. Comprehensive information on budget effects is not yet available.
- 3 See Deutsche Bundesbank (2019a), p. 67.

Deutsche Bundesbank

as well as a shortage of construction and labour market capacities. In this regard, it is also important to ensure that additional spending does not dissipate in the face of higher prices.

Public finances are supporting economic activity, currently no need for economic stimulus packages Germany is being called upon by some to launch a larger economic stimulus package. However, with regard to cyclical developments, this does not appear to be necessary at present. For the most part, the economic situation is regarded as being more or less within the normal range; the majority of forecasts envisage that economic growth will pick up again and do not foresee a much greater degree of slack. In this context, public finances are already stabilising Germany's economic growth appreciably. As described above, the fiscal policy stance is already expansionary - even in the absence of additional measures - and the automatic stabilisers are also operating. The considerable risks to the economic outlook, resulting primarily from the external environment, are nonetheless to be borne in mind. Should economic activity slump and aggregate capacity become substantially underutilised, fiscal policy would also be called upon to spur the economy (as was the case during the economic crisis of 20094). This is also in line with the fiscal rules and the escape clauses they include for economic downturns. The fact that the German government's finances are sound would then facilitate a sizeable contribution to stability.

Budgetary development of central, state and local government

Tax revenue

Tax revenue⁵ growth in the third quarter was robust; it increased by 31/2% on the year (see the adjacent chart and the table on p. 60). Wage tax growth remained dynamic, at 61/2%. Child benefits, which are deducted from tax revenue, rose by €10 each month as of July, depressing the growth rate in the third quarter by around 1 percentage point. However, a negotiated special payment in the metal-working and electrical engineering industries had a bolstering effect. Progressive taxation was dampened by tax relief measures, among them an adjustment to the tax scale to compensate for last year's bracket creep. Profit-related taxes overall stagnated at a high level. Of these, assessed income tax continued to record dynamic growth, and corporation tax also rose significantly. By contrast, non-assessed taxes on earnings (which mainly consist of investment income tax on dividends) recorded a sharp decline. In year-on-year terms, however, the fact that profit distribution shifts within the year repeatedly plays a role here, masking the underlying trend. The decrease in the third quarter offsets the sharp rise seen in the first half of the year. Withholding tax on interest income and capital gains continued to decline. Turnover tax revenue, which is guite volatile over the course of the year, increased by 3%.

According to the latest official tax estimate, tax revenue (including local government taxes) is expected to rise by 2½% for 2019 as a whole. In the estimation model, the assumed macro-

robust tax revenue growth in Q3

⁴ See also Deutsche Bundesbank (2010).

⁵ Here, tax revenue includes EU shares in German tax revenue, but excludes receipts from local government taxes, which are not yet known for the quarter under review.

59

The official tax estimate is drawn up by the Working Party on Tax Revenue Estimates (Arbeitskreis Steuerschätzungen), which is chaired by the Federal Ministry of Finance. It combines input from experts at the Federal Ministry for Economic Affairs and Energy, the federal states' finance ministries, five economic research institutions, the Federal Statistical Office, the German Council of Economic Experts, the German Confederation of Local Authority Central Associations (Bundesvereinigung kommunaler Spitzenverbände) and the Bundesbank.¹

Macroeconomic assumptions

The official tax estimate is based on the Federal Government's latest macroeconomic projection (see the table on p. 61). This comprises a short-term projection for the current year, the next year and (in the autumn) the year after, as well as a medium-term projection covering the years subsequent to that. In the medium-term projection, it is assumed that any output gap existing at the end of the short-term projection horizon will be closed by the final year of the medium-term projection. Uniform rates of economic growth are applied for these years.

Applicable tax legislation

The tax estimate is based on the tax legislation applicable at that time. This means, for instance, that revenue losses stemming from the partial abolition of the solidarity surcharge were not yet factored into the current estimate. The Family Relief Act (Familienentlastungsgesetz), for example, had a substantial impact on the current estimate, as it did on the May 2019 estimate.

Amongst other objectives, this legislation is intended to offset bracket creep caused by inflation experienced in the previous year.

Impact of court rulings

In addition, the tax estimate factors in the impact of court rulings (some dating back quite a long time), which can have a significant effect on revenue growth. As in previous estimates, the current estimate contains revenue losses resulting from such rulings. As well as factoring in a ruling on VAT (see footnote 6 on p. 60), the estimate assumes perceptibly decreased revenue in non-assessed taxes on earnings.² Furthermore, the current estimate takes account of revenue shortfalls stemming from an administrative order issued in connection with a decision regarding interest paid on tax arrears.³

In terms of statistical recording, the effects of court rulings on government finances are reported in different ways in the financial statistics (on which the tax estimate is based) and the national accounts. In the financial statistics, court rulings reduce tax revenue when the repayments are made (cash basis accounting). In the national accounts, however, they are recorded as government spending (capital transfers) as soon as the decision takes legal effect. This means that the point in time at which the effects are recorded in the national accounts sometimes lies well in advance of the cash outflow.

Deutsche Bundesbank

economic growth, including progressive taxation, makes for a slightly higher increase. However, this is dampened to a marked extent, on balance, by legislative changes. This primarily concerns the Family Relief Act (Familienentlastungsgesetz), which includes the abovementioned compensation for bracket creep, amongst other things. Aside from this, though, other measures such as the raised immediate write-off threshold for low-value assets also result in shortfalls. In addition, repayments are expected in connection with a VAT ruling made some time ago.6

A 21/2% increase in revenue is also expected for the coming year. Macroeconomic developments and legislative changes are forecast to have more or less the same impact overall as they did this year. While the Family Relief Act will dampen revenue growth by a little more than in 2019, other legislative changes will play a less important role.

Revenue growth of 31/2% is expected for each of the subsequent years up to 2024. This largely reflects the macroeconomic assumptions and progressive taxation. In net terms, revenue shortfalls from legislative changes and court rulings will weigh only marginally on growth. The tax ratio (as defined in the government finance statistics) is projected to increase to 23.6% in 2024 (2018: 23.2%). By contrast, it would remain at more or less its current level if the specified measures that have not yet been included in the official estimate were to be taken into account (particularly the partial abolition of the solidarity surcharge). In addition, the extension of compensation for bracket creep beyond 2020 and a further significant increase in child benefits in 2021 were set out in the coalition agreement. These would cause the ratio to sink slightly.

Revenue expectations from May slightly adjusted

Compared with the May forecast, additional revenue of €2½ billion is envisaged for 2019. The favourable development of cash revenue in wage and income tax up to now is having a positive impact. The slight upward revision of the macroeconomic reference variables for tax revenue⁷ also partly explains the adjustment. The total revenue forecast for 2020, however, is €1½ billion lower than was estimated in the spring. This is attributable to the downward revision of the macroeconomic assumptions. Carrying forward the increased revenue level from 2019 is having a supportive effect. The downward revision of the macroeconomic assumptions is also a key factor for the revenue shortfalls in subsequent years. Legislative changes, such as tax deductions for the construction of new rental accommodation, constitute an additional burden. The downward revisions amount to between €2 billion (2021) and €3½ billion (2023) in total.

Central government budget

Central government recorded a surplus of €2 billion in the third quarter, compared with a deficit of €4 billion one year previously. However, if interest expenditure had not been recorded ahead of time (in the second quarter), the result would have deteriorated by around

€1 billion. Revenue rose by 1½%, chiefly on account of increased tax revenue (+2%, or €1½ billion, after deduction of additional transfers of €½ billion to the EU budget). Adjusted for the special effect on interest expenditure, spending growth somewhat exceeded revenue growth. Other operating expenditure (particularly payments for military procurements) increased especially strongly. In addition, current transfers (to the pension insurance scheme in particular) and capital transfers rose significantly. By contrast, interest expenditure continued to decline significantly, even excluding the special effect.

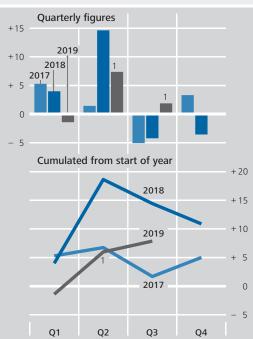

After three quarters, the central government budget recorded a surplus of €8 billion, compared with €14½ billion in the previous year. For the year as a whole, the budget plan envisages a deficit of €6 billion (end-2018: surplus of €10½ billion). As things currently stand, a rather moderate deterioration and a much better annual result than planned can be expected. According to the latest tax estimate, revenue is set to exceed the budget estimate by €2 billion. Interest expenditure is easing the pressure yet

Interest expenditure, in particular, significantly more favourable than planned; another surplus possible for year as a whole

Slightly poorer result in Q3, disregarding special effect on interest expenditure

⁷ Although the GDP growth rate from May was barely revised (see the table above), the variables relevant to tax revenue saw a slight upward revision overall, particularly in private consumption and entrepreneurial and investment income.

Source: Bundesbank calculations based on data from the Federal Ministry of Finance. * Core budget excluding off-budget entities. Not adjusted for financial transactions or cyclical effects. 1 Not adjusted for interest burdens recorded ahead of time (€7 hillion)

Deutsche Bundesbank

further; instead of rising by €1 billion as envisaged, it continues to fall sharply. By the end of September, it had decreased by €3½ billion altogether. Other items, such as investment grants and repayments from the EU, are developing more favourably than accounted for in the budget. Overall, the central government budget is therefore expected to end the current year with a surplus, too. Should this be the case, it would not be necessary to withdraw €5½ billion from the refugee reserve in order to avoid net borrowing, as was originally planned. Instead, a significant sum could again be set aside.

Significant reduction in reserves planned in the 2020 draft budget In the summer, Federal Government submitted the draft budget for 2020. It envisaged a relatively large deficit of €9½ billion. This was intended to be almost entirely covered by the refugee reserve in order to achieve a balanced budget with no net borrowing once more. Increased expenditure in areas such as national

defence and family policy was largely offset in the budget plan by a global spending cut.

In October, Federal Government's climate policy resolutions that would affect the budget were incorporated into parliamentary deliberations. As of next year, additional Federal budget expenditure is planned. Supplementary climate policy actions and, in particular, annual capital injections of €1 billion into Deutsche Bahn are envisaged. This should allow Deutsche Bahn to extend its range of (relatively lowemission) transport services. Furthermore, the VAT charged for long-distance train tickets is to be reduced and air ticket taxes increased. From 2021 onwards, allowances for CO₂ emissions from transport and building heating are to be introduced. These will initially be available for purchase at a fixed price per tonne of CO₂ emitted. This price is intended to rise from an initial €10 to €35 in 2025. As of 2026, the maximum emissions volume, which is to be lowered in increments, will govern price formation - initially still within limits. Higher energy costs for households and enterprises are to be partially offset. There are also plans to temporarily expand the standard travel allowance within the income tax regime and to reduce the renewable energy (EEG) levy on electricity consumption. Particularly hard-hit enterprises are set to receive compensation.

On balance, the climate programme will only burden the Federal budget to a limited extent. It will entail new costs, but transfers to the energy and climate fund will decrease from 2020 onwards. The fund will receive all proceeds from the sale of the new emissions allowances and will initially draw more heavily on its reserves. The aim of the climate package is to reduce CO_2 emissions, in line with the EU agreements. Many doubt that this package is sufficient for this purpose. However, a regular assessment is planned in order to respond to missed targets. Should Germany exceed its permitted emissions volume, the Federal budget risks incurring financial penalties.

Climate programme ...

... likely to entail limited additional burdens at most Final deliberations include continued commitment to balanced budget, but slightly higher deficit

Further adjustments were made to central government's 2020 budget during final deliberations. There was no need for major adjustments in connection with October's tax estimate. Compared with the summer draft budget, though, tax revenue was revised downwards by €3 billion in order to factor in planned legislative changes. For example, central government's contributions towards the refugee costs incurred at the state and local government level have been extended. Turning to other revenue, return flows from guarantees were down. To balance the revenue shortfalls, a precautionary global revenue shortfall item of €3½ billion was dissolved. In addition to a series of smaller-scale additional spending authorisations, there were, in particular, higher burdens associated with the basic allowance for job seekers on the expenditure side. Including another full refund of refugee-related spending on accommodation by local governments, additional expenditure amounts to €1½ billion here. Over and above extra spending to cover the costs of the climate programme, investment expenditure was raised by €1 billion. The significant downward revision of the interest expenditure estimate (-€3 billion) only partially offsets additional spending. The bulk of the €11 billion deficit – up by €1½ billion compared with the draft budget – is to be covered by the refugee reserve. The objective of a balanced budget with no net borrowing will thus be achieved.

Compliance with debt brake rules maintained by means of reserve withdrawals The debt brake imposes limits on the level of structural net borrowing by central government and on relevant off-budget entities' deficits. Reserve withdrawals in the central government budget therefore balance out the relatively high planned deficits that it contains. Effects arising from financial transactions and economic conditions are factored out, which improves the structural outturn by €1 billion.⁸ At last report, a deficit of €6 billion was estimated for the off-budget entities. All in all, structural net borrowing is thus likely to run up to around €5 billion. Thanks to the substantial

reserve withdrawals, the €11½ billion ceiling will be significantly undershot.

Overall, the budget plans for 2020 appear to have been drawn up with less caution than in previous years. Despite this, expenditure could increase at a somewhat slower rate than implied by the global spending cuts. Revenue could also develop more favourably. For example, transfers to the EU budget appear to have been cautiously calculated. Based on past experience, return flows will also probably be higher than estimated. All things considered, budgeted figures could therefore be notably exceeded next year, too. Given the greater budgetary scope overall, it could be worth examining whether to scale back the solidarity surcharge as early as next year. On the whole, it would appear appropriate to completely abolish this surcharge and, if necessary, to combine this step with a more fundamental tax reform.9

once again more favourable than planned

Developments

According to data from the Federal Ministry of Finance, central government's off-budget entities recorded a surplus of €2 billion in the third quarter, compared with €3 billion in the same period last year.¹¹⁰ This lower figure is due in large part to the development of the energy and climate fund: its surplus was smaller following the €1 billion reduction in the transfer allocated to it in the central government budget.

Reduced surplus for central government's off-budget entities in Q3

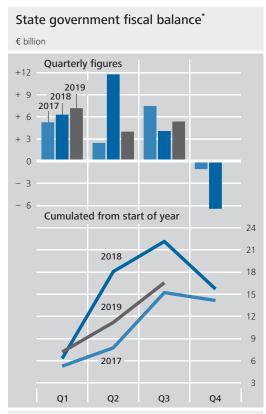

The surplus for 2019 as a whole is expected to be somewhat lower than in 2018 (€6 billion). The main reason for this is that central government transfers to the energy and climate fund

Slightly lower surplus in 2019 as a whole and deficit possible next year

8 For example, the capital injection given to Deutsche Bahn is classified as a financial transaction and thus does not count towards the structural outturn. However, a comparable payment in 2017 was classified in the national accounts as a capital transfer rather than an acquisition of financial assets. The capital injection's classification as a financial transaction in the central government budget therefore does not appear appropriate.

9 For more information, see Deutsche Bundesbank (2019a), p. 67.

10 SoFFin is factored out here because the considerable financial resources it borrows to refinance central government's bad bank count towards the balance.

Source: Bundesbank calculations based on monthly data from the Federal Ministry of Finance. * Federal states' core budgets excluding off-budget entities. Deutsche Bundesbank

and the digitalisation fund have been reduced by a total of €3½ billion. While the latter will receive the proceeds from the auction of 5G frequencies that came to an end in June (€6½ billion), these will be staggered due to a separate agreement on further network expansion. The absence of the €1 billion burden in 2018 resulting from the redemption of an inflationlinked central government security will provide a slightly more significant counterweight. Next year's balance will depend heavily on the extent to which funds are used for local investment and to combat climate change. In any event, the energy and climate fund's reserves are set to be significantly reduced next year as part of the climate programme. As a result, the off-budget entities could even close the year with a slight deficit overall.

State government budgets¹¹

Core state government budgets posted a surplus of €5½ billion in the third quarter, compared with €4 billion in the same quarter last year. Revenue rose sharply by 6%, driven by the rise in tax revenue (5%). Transfers from public administrations grew slightly faster still. This was partly attributable to the fact that some of these were recorded at a later point in time than last year, which had led to a marked decline in the second quarter. Expenditure rose at a slightly slower rate (5%) than revenue. In addition to other operating expenditure (6%), staff costs - a major spending component rose sharply (61/2%). The latter reflects rises in remuneration for salaried employees and pay for civil servants, as well as back-payments in connection with these. Staff increases probably also had a part to play. Growth in payments to administrations and the less significant expenditure on fixed asset formation was especially strong (14% and 141/2%, respectively). By contrast, interest expenditure declined considerably. Other expenditure was also down on the year. The main reason for this was that, in North Rhine-Westphalia, payments to universities had been brought forward into the second quarter.

After three quarters, the surplus of the core budgets stood at €16½ billion and was thus €5½ billion lower than one year previously. As the final quarter of 2018 was marked by high payments for HSH Nordbank, the balance for the year as a whole could once again come close to the balance recorded in the previous year (+€15½ billion). The medium-term outlook for state government finances also remains bright. The expectation set out in the latest tax estimate is that medium-term revenue growth will be somewhat lower than previously estimated but will remain robust. Consequently, there should still be budgetary scope for, inter

Year-on-year rise in surplus in Q3

High surplus foreseeable for year as a whole and outlook bright for medium term as well alia, higher investment in infrastructure or better educational opportunities.

State-specific debt brake rules in all federal states; obtaining a detailed overview proves challenging

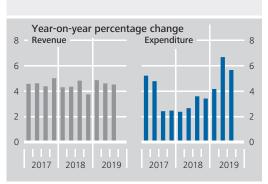

From 2020 onwards, the debt brake under German Basic Law will apply to state government budgets. Under the debt brake, federal states will, as a rule, be required to balance their budgets with no net new borrowing. One particular area in which exceptions will apply is cyclical budget fluctuations. At the end of 2018, the debt brake had yet to be incorporated into the state legislation of three federal states.12 During 2019, the state constitutions of Saarland and Brandenburg were amended accordingly and the provisions fleshed out in their state budgetary acts. In Berlin, the debt brake shall only be implemented in its budgetary act together with a corresponding implementing act. Furthermore, Baden-Württemberg and North Rhine-Westphalia are reworking the debt brakes in their state budgetary acts. With respect to cyclical adjustment, for instance, the state legislators are amending their rules in line with Stability Council decisions. 13 All federal states are thus planning to incorporate the debt brake into state legislation before the ban on new borrowing comes into force. The rules vary a great deal from one federal state to the next and differ in terms of how they are enshrined in law. It is very difficult to obtain an up-to-date overview. A summary of the main design features, references in the respective state legislation and information on amendments that have been made in the meantime would be helpful. Such a summary could, for example, be provided and updated on a continuous basis by the Stability Council.

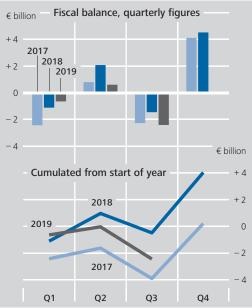

Social security funds

Pension insurance scheme

Slight deterioration in result in Q3 As usual, the statutory pension insurance scheme recorded a deficit in the third quarter. At €2½ billion, it was €1 billion higher than a year ago. Although revenue increased sharply (+4½%) thanks to continued positive employ-

Finances of the German statutory pension insurance scheme*

Deutsche Bundesbank

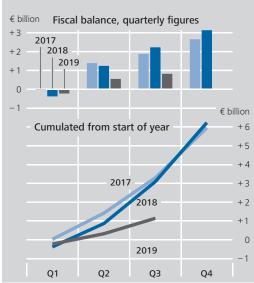

ment and wage developments, expenditure rose at an even higher rate of 5½%. Of this increase, "mothers' pensions", which were expanded at the start of the year, account for 1½ percentage points (+€1 billion compared with the same quarter last year). Other factors that raised spending were the July 2019 pension adjustment (national average: +3½%) and a moderate rise in the number of pensions. The return to parity financing of the statutory health insurance scheme is also putting pressure on

the pension insurance scheme. Since the start of the year, the pension insurance scheme has been paying half of the supplementary contributions for pension recipients.

outturn would still be a significant improve-

ment on the figure estimated in the Federal

Cumulated over the first three guarters, the deficit was €2 billion higher than in the previous year (-€1/2 billion). Nevertheless, a marked surplus should still be recorded for the year as a whole due to contribution receipts typically being higher in the last quarter of the year. While this is likely to fall far short of the surplus generated the year before (+€4½ billion), the Government's pension insurance report in the fourth quarter of 2018 (deficit of €1½ billion).

The favourable financial situation in which the statutory pension insurance scheme currently finds itself should not detract from the fact that demographically driven budgetary strains are looming. 14 Rising deficits are on the cards in the years ahead. The Federal Government has announced a reform of the statutory pension insurance scheme for the period after 2025.

Rising deficits on the cards

Pension adjustment modified

The Bundestag modified the annual pension adjustment formula with effect from 2020.15 Pensions are based on changes in the level of income subject to compulsory insurance contributions. However, these data are only available with a lag of almost one year. For this reason, the mid-year annual adjustment is initially carried out using national accounts data available at that point in time (effectively on a temporary basis). Following major national accounts revisions, annual pension adjustments could sometimes be quite erratic. The change in the rules was introduced in response to the most recent national accounts revision, according to which the level of gross wages and salaries per employee is currently around 2% higher. Under the rules previously in place, this would have led to wildly fluctuating pension adjustments: in mid-2020, the adjustment would have been egual to the level shift, i.e. it would have been around 2 percentage points higher, and this would then have been offset by a correspondingly lower adjustment in mid-2021.16 Under the new rules, such a leap between two datasets no longer has any effect on annual pension adjustments. As previously, pensions are brought closer into line with changes in the

Significant deterioration in result for year as a whole, but surplus still marked

¹⁴ See also Deutsche Bundesbank (2019c).

¹⁵ The change was added in the draft Act Amending the Act on the Establishment of the German Statutory Pension Insurance Scheme and German Pension Insurance for Miners, Railway and Maritime Workers (Gesetzentwurf zur Änderung des Gesetzes zur Errichtung der Deutschen Rentenversicherung Bund und der Deutschen Rentenversicherung Knappschaft-Bahn-See).

¹⁶ For information on the relatively complex underlying reasons for this, see Deutsche Bundesbank (2014), pp. 75-

level of income subject to compulsory insurance contributions once the relevant data become available. Following the new methodology instead of the old, the pension adjustments will be lower in 2020 and higher in 2021. The load on the reserves will thus be lightened by around €6 billion.

ber of unemployment benefit recipients went up again. The number of recipients remains at a very low level, however. As advanced vocational training schemes have been expanded significantly since the start of this year, spending on active labour market policy measures rose by a considerable 5½%.

Federal Employment Agency

Significantly reduced surplus in O3

The third quarter saw the Federal Employment Agency post a surplus of €1 billion in the core budget.¹⁷ In a year-on-year comparison, however, the surplus was down by €1½ billion. Revenue declined by €1 billion, or 9%, on the back of the considerable contribution rate cut at the start of the year (by 0.5 percentage point to 2.5%). Wages and employment remained upbeat. Had the contribution rate remained unchanged, revenue would have risen by almost 4½%. Spending on unemployment benefits increased by a very substantial 11½%. While registered unemployment as a whole (including unemployment among job seekers receiving the basic allowance) fell once more, the num-

The main lines of development are likely to remain unchanged in the final quarter. This would make the surplus much smaller than in the previous year (2018: just over €6 billion). However, it is likely to be much higher than expected (€½ billion) on account of expenditure coming in way under budget. As a result, the free reserves will probably continue to build, and the threshold of 0.65% of GDP – the point at which the Federal Government considers cutting the contribution rate – will presumably be significantly exceeded. Overall, the planned additional small reduction of 0.1 percentage point for the years 2020 to 2022 is viable.

Marked surplus again for year as a whole, but much lower than in previous year

17 Excluding the civil servants' pension fund. Transfers to the fund are thus recorded as expenditure reducing the core budget balance.

^{*} The data in this table are based on the consolidated balance sheet of monetary financial institutions (MFIs) (Table II.2); statistical breaks have been eliminated from the flow figures (see also the "Notes on the figures" in the "Explanatory notes" in the Statistical Supplement 1 to the Monthly Report, p. 30°). 1 Source: ECB. 2 Excluding

MFIs' portfolios. **3** After deduction of inter-MFI participations. **4** Including the counterparts of monetary liabilities of central governments. **5** Including the monetary liabilities of central governments (Post Office, Treasury). **6** In Germany, only savings deposits. **7** Paper held by residents outside the euro area has been eliminated.

8 Less German MFIs' holdings of paper issued by euro area MFIs. **9** Including national banknotes still in circulation. **10** The German contributions to the Eurosystem's monetary aggregates should on no account be interpreted as national monetary aggregates and are therefore not comparable with the erstwhile German

money stocks M1, M2 or M3. **11** The difference between the volume of eurobanknotes actually issued by the Bundesbank and the amount disclosed in accordance with the accounting regime chosen by the Eurosystem (see also footnote 2 on banknote circulation in Table III.2).

volume of euro banknotes put into circulation by the Bundesbank in accordance with the accounting regime chosen by the Eurosystem (see also footnote 2 on banknote circulation in Table III.2). The volume of currency actually put into circulation by the

Bundesbank can be calculated by adding to this total the item "Intra-Eurosystem liability/claim related to banknote issue" (see "Other liability items"). **5** Excluding central governments' deposits. **6** In Germany, only savings deposits.

Discrepancies may arise from rounding. * The banking system's liquidity position is defined as the current account holdings in euro of euro area credit institutions with the Eurosystem. Amounts are derived from the consolidated financial statement of the Eurosystem and the financial statement of the Bundesbank. 1 Figures are daily averages for the reserve maintenance period ending in the month indicated. Following the changeover in the frequency of Governing Council monetary policy meetings to a six-week cycle, a reserve maintenance period no longer ends in every month. No

figures are available in such cases. **2** Source: ECB. **3** Includes liquidity provided under the Eurosystem's asset purchase programmes. **4** From August 2009 includes liquidity absorbed as a result of the Eurosystem's foreign exchange swap operations. **5** From 2002 euro banknotes and other banknotes which have been issued by the national central banks of the Eurosystem and which are still in circulation. In accordance with the accounting procedure chosen by the Eurosystem for the issue of euro banknotes, a share of 8% of the total value of the euro banknotes in circulation is

allocated to the ECB on a monthly basis. The counterpart of this adjustment is shown under "Other factors". The remaining 92% of the value of the euro banknotes in circulation is allocated, likewise on a monthly basis, to the NCBs, with each NCB showing in its balance sheet the share of the euro banknotes issued corresponding to its paid-up share in the ECB's capital. The difference between the value of the euro banknotes allocated to an NCB and the value of the euro banknotes which that NCB has put into circulation is likewise shown under "Other

factors". From 2003 euro banknotes only. **6** Remaining items in the consolidated financial statement of the Eurosystem and the financial statement of the Bundesbank. **7** Equal to the difference between the sum of liquidity-providing factors and the sum of liquidity-absorbing factors. **8** Calculated as the sum of the "Deposit facility", "Banknotes in circulation" and "Credit institutions' current account balances".

^{*} The consolidated financial statement of the Eurosystem comprises the financial statement of the European Central Bank (ECB) and the financial statements of the national central banks of the euro area Member States (NCBs). The balance sheet items for foreign currency, securities, gold and financial instruments are valued at market rates at the end of the quarter. 1 In accordance with the accounting

procedure chosen by the Eurosystem for the issue of euro banknotes, a share of 8% of the total value of the euro banknotes in circulation is allocated to the ECB on a monthly basis. The counterpart of this adjustment is disclosed as an "Intra-Eurosystem liability related to euro banknote issue". The remaining 92% of the value of the euro banknotes in circulation is allocated, likewise on a monthly

basis, to the NCBs, with each NCB showing in its balance sheet the share of the euro banknotes issued corresponding to its paid-up share in the ECB's capital. The difference between the value of the euro banknotes allocated to the NCB according to the aforementioned accounting procedure and the value of euro banknotes put

into circulation is also disclosed as an "Intra-Eurosystem claim/liability related to banknote issue". **2** For the Deutsche Bundesbank: including DEM banknotes still in circulation. **3** Source: ECB.

governments. **3** In Germany, debt securities with maturities of up to one year are classed as money market paper; up to the January 2002 Monthly Report they were

published together with money market fund shares. 4 Statistical breaks have been eliminated from the flow figures (see also footnote * in Table II.1).

2. Principal assets and liabilities of banks (MFIs) in Germany, by category of banks*

^{*} Assets and liabilities of monetary financial institutions (MFIs) in Germany. The assets and liabilities of foreign branches, of money market funds (which are also classified as MFIs) and of the Bundesbank are not included. For the definitions of the respective items, see the footnotes to Table IV.3. 1 Owing to the Act Modernising Accounting Law (Gesetz zur Modernisierung des Bilanzrechts) of 25 May 2009, derivative financial instruments in the trading portfolio (trading portfolio derivatives) within the meaning of Section 340e(3) sentence 1 of the German Commercial Code (Handels-

gesetzbuch) read in conjunction with Section 35(1) number 1a of the Credit Institution Accounting Regulation (Verordnung über die Rechnungslegung der Kreditinstitute) are classified under "Other assets and liabilities" as of the December 2010 reporting date. Trading portfolio derivatives are listed separately in Statistical Supplement 1 to the Monthly Report – Banking statistics, in Tables I.1 to I.3. 2 For building and loan associations: including deposits under savings and loan contracts (see Table IV.12). 3 Included in time deposits. 4 Excluding deposits under savings and

^{*} Excluding assets and liabilities and/or transactions of foreign branches. The figures for the latest date are always to be regarded as provisional. Subsequent revisions, which appear in the following Monthly Report, are not specially marked. 1 Including claims on building and loan associations, claims arising from registered debt securities and central bank credit balances. 2 Loans under savings and loan contracts and interim and bridging loans. 3 Including money market paper and small amounts of other securities issued by banks. 4 Including equalisation claims. 5 Including liabilities to building and loan associations. 6 Including small amounts of savings deposits. 7 Including participation rights capital and fund for general banking risks.

⁸ Total amount covered by the contracts; only contracts newly entered into, for which the contract fee has been fully paid. Increases in the sum contracted count as new contracts. **9** For disbursements of deposits under savings and loan contracts arising from the allocation of contracts see "Capital disbursed". **10** Including housing bonuses credited. **11** Only allocations accepted by the beneficiaries; including allocations applied to settlement of interim and bridging loans. **12** The amounts already credited to the accounts of savers or borrowers are also included in "Amounts paid into savings and loan accounts" and "Interest and repayments received on building loans". **13** See Table IV.2, footnote 1.

¹ The reserve maintenance period starts on the settlement day of the main refinancing operation immediately following the meeting of the Governing Council of the ECB for which the discussion on the monetary policy stance is scheduled. 2 Article 3 of the Regulation of the European Central Bank on the application of minimum reserves (excluding liabilities to which a reserve ratio of 0% applies, pursuant to Article 4(1)). 3 Amount after applying the reserve ratio to the reserve base. The reserve ratio for liabilities with agreed maturities of up to two years was

^{2%} between 1 January 1999 and 17 January 2012. Since 18 January 2012, it has stood at 1%. **4** Article 5(2) of the Regulation of the European Central Bank on the application of minimum reserves. **5** Average credit balances of credit institutions at national central banks. **6** Average credit balances less required reserves after deduction of the lump-sum allowance. **7** Required reserves after deduction of the lump-sum allowance.

^{*} The interest rate statistics gathered on a harmonised basis in the euro area from January 2003 are collected in Germany on a sample basis. The MFI interest rate statistics are based on the interest rates applied by MFIs and the related volumes of euro-denominated deposits and loans to households and non-financial corporations domiciled in the euro area. The household sector comprises individuals (including sole proprietors) and non-profit institutions serving households. Non-financial corporations include all enterprises other than insurance corporations, banks and other financial institutions. The most recent figures are in all cases to be regarded as provisional. Subsequent revisions appearing in the following Monthly Report are not specially marked. Further information on the MFI interest rate statistics can be found on the Bundesbank's website (Statistics/Money and capital markets/Interest rates and yields/Interest rates on deposits and loans). o The statistics on outstanding amounts are collected at the end of the month. 1 The effective interest rates are calculated

either as annualised agreed interest rates or as narrowly defined effective rates. Both calculation methods cover all interest payments on deposits and loans but not any other related charges which may occur for enquiries, administration, preparation of the documents, guarantees and credit insurance. 2 Data based on monthly balance sheet statistics. 3 Secured and unsecured loans for home purchase, including building and home improvements; including loans granted by building and loan associations and interim credits as well as transmitted loans granted by the reporting agents in their own name and for their own account. 4 Loans for consumption are defined as loans granted for the purpose of personal use in the consumption of goods and services. **5** For the purpose of these statistics, other loans are loans granted for other purposes such as business, debt consolidation, education, etc. **6** Including overdrafts (see also footnotes 12 to 14 on p. 47°).

For footnotes * and 1 to 6, see p. 44°. + For deposits with an agreed maturity and all loans excluding revolving loans and overdrafts, credit card debt: new business covers all new agreements between households or non-financial corporations and the bank. The interest rates are calculated as volume-weighted average rates of all new agreements concluded during the reporting month. For overnight deposits, deposits redeemable at notice, revolving loans and overdrafts, credit card debt: new business is collected in the same way as outstanding amounts for the sake of simplicity. This

means that all outstanding deposit and lending business at the end of the month has to be incorporated in the calculation of average rates of interest. **7** Estimated. The volume of new business is extrapolated to form the underlying total using a grossing-up procedure. **8** Including non-financial corporations' deposits; including fidelity and growth premiums. **9** Excluding overdrafts. **10** Annual percentage rate of charge, which contains other related charges which may occur for enquiries, administration, preparation of the documents, guarantees and credit insurance.

For footnotes * and 1 to 6, see p. 44°. For footnotes + and 7 to 10, see p. 45°. 11 For the purposes of the interest rate statistics, a loan is considered to be secured if collateral (amongst others financial collateral, real estate collateral, debt securities) in at least the same value as the loan amount has been posted, pledged or assigned. 12 Including revolving loans which have all the following features: (a) the borrower may use or withdraw the funds to a pre-approved credit limit without giving prior notice to the lender; (b) the amount of available credit can increase and decrease as funds are borrowed and repaid; (c) the loan may be used repeatedly; (d) there is no obligation of regular repayment of funds. 13 Overdrafts are defined as

debit balances on current accounts. They include all bank overdrafts regardless of whether they are within or beyond the limits agreed between customers and the bank. 14 Including convenience and extended credit card debt. Convenience credit is defined as the credit granted at an interest rate of 0% in the period between payment transactions effected with the card during one billing cycle and the date at which the debt balances from this specific billing cycle become due. 15 The amount category refers to the single loan transaction considered as new business. x Dominated by the business of one or two banks. Therefore, the value cannot be published because of confidentiality.

Sources: The calculations for the insurance sectors are based on supervisory data according to Solvency I and II. Pension funds data are compiled using Solvency I supervisory data, supplemented by voluntary reports and own calculations. * Valuation of listed securities at the corresponding consistent price from the ESCB's securities database. 1 Accounts receivable to monetary financial institutions, including registered bonds, borrowers' note loans and registered Pfandbriefe. 2 Including deposits retain-

ed on assumed reinsurance as well as registered bonds, borrowers' note loans and registered Pfandbriefe. **3** Not including the reinsurance business conducted by primary insurers, which is included there. **4** The term "pension funds" refers to the institutional sector "pension funds" of the European System of Accounts. Pension funds thus comprise company pension schemes and occupational pension schemes for the self-employed. Social security funds are not included.

Sources: The calculations for the insurance sectors are based on supervisory data according to Solvency I and II. Pension funds data are compiled using Solvency I supervisory data, supplemented by voluntary reports and own calculations. 1 Including deposits retained on ceded business as well as registered bonds, borrowers' note loans and registered Pfandbriefe. 2 Insurance technical reserves "life" taking account of transitional measures. Health insurance is also included in the "non-life insurance" sec-

tor. **3** Not including the reinsurance business conducted by primary insurers, which is included there. **4** The term "pension funds" refers to the institutional sector "pension funds" of the European System of Accounts. Pension funds thus comprise company pension schemes and occupational pension schemes for the self-employed. Social security funds are not included. **5** Own funds correspond to the sum of net worth and the liability item "Shares and other equity".

¹ Bearer debt securities with maximum maturities according to the terms of issue of over 4 years if their mean residual maturities exceed 3 years. Convertible debt securities and similar, debt securities with unscheduled redemption, zero coupon bonds, floating rate notes and bonds not denominated in euro are not included. Group yields for the various categories of securities are weighted by the amounts out-

standing of the debt securities included in the calculation. Monthly figures are calculated on the basis of the yields on all the business days in a month. The annual figures are the unweighted means of the monthly figures. **2** End of year or month. **3** Source: Deutsche Börse AG. **4** Only debt securities eligible as underlying instruments for futures contracts; calculated as unweighted averages.

Source: Bundesbank calculations based on Federal Statistical Office data. 1 Annual figures based on the calculations of the Federal Statistical Office. Bundesbank supplementary estimations for the reporting years after 2011 that are not yet available. The quarterly figures contain numerous off-budget entities which are assigned to the general government sector as defined in the national accounts but are not yet included in the annual calculations. From 2012 also including the bad bank FMSW. 2 The annual figures do not tally with the sum of the quarterly figures, as the

latter are all provisional. The quarterly figures for some insurance sectors are estimated. **3** The development of the types of expenditure recorded here is influenced in part by statistical changeovers. **4** Including discrepancies in clearing transactions between central, state and local government. **5** On the revenue side, this contains proceeds booked as disposals of equity interests and as loan repayments. On the expenditure side, this contains the acquisition of equity interests and loans granted. **6** Including central government liquidity assistance to the Federal Employment Agency.

Source: Federal Ministry of Finance and Bundesbank calculations. 1 This total, unlike that in Table X. 5, does not include the receipts from the equalisation of burdens levies, local business tax (less local business tax transfers to central and state government), real property taxes and other local government taxes, or the balance of untransferred tax shares. 2 Respective percentage share of central, state and local government in revenue: wage tax and assessed income tax 42.5:42.5:15, corporation tax and non-assessed taxes on earnings 50:50:-, final withholding tax on interest income and capital gains, non-assessed taxes on earnings 44:44:12. 3 After

deducting child benefit and subsidies for supplementary private pension plans. 4 Final withholding tax on interest income and capital gains, non-assessed taxes on earnings. 5 The allocation of revenue to central, state and local government, which is adjusted at more regular intervals, is regulated in Section 1 of the Revenue Adjustment Act. Respective percentage share of central, state and local government in revenue for 2018: 49.6:47.2:3.2. The EU share is deducted from central government's share. 6 Respective percentage share of central and state government for 2018: 22.7:77.3. 7 For the breakdown, see Table X. 7.

Sources: Federal Statistical Office; Federal Employment Agency. * Annual and quarterly figures: averages; calculated by the Bundesbank; deviations from the official figures are due to rounding. 1 Workplace concept; averages. 2 Monthly figures: end of month. 3 Number within a given month. 4 Mid-month level. 5 Relative to the total civilian labour force. 6 Excluding government-assisted forms of employment and seasonal jobs, including jobs located abroad. 7 From January 2017 persons receiving additional income assistance (unemployment benefit and unemployment benefit II at the same time) shall be assigned to the legal category of the Third Book the basis of the Social Security Code (SGB III) 8 Unadjusted figures estimated by the Federal Em-

ployment Agency. In 2017 and 2018, the estimated values for Germany deviated from the final data by a maximum of 0.2% for employees subject to social contributions, by a maximum of 0.4% for persons solely in jobs exempt from social contributions, and by a maximum of 70.0% for cyclically induced short-time work. **9** Statistical break due to late recording of unemployed persons in the legal category of the Second Book of the Social Security Code (SGB II). **10** From May 2019, calculated on the basis of new labour force figures. **11** Initial preliminary estimate by the Federal Statistical Office.

^{*} Non-financial groups admitted to the Prime Standard segment of the Frankfurt Stock Exchange which publish IFRS consolidated financial statements on a quarterly or half-yearly basis and make a noteworthy contribution to value added in Germany. Excluding groups engaged in real estate activities. 1 Earnings before interest, taxes, depreciation and amortisation. 2 Quantile data are based on the groups' unweighted return on sales. 3 Annual figures do not always match the sum of the two half-year

figures. See Quality report on consolidated financial statement statistics, p. 3. 4 Adjusted for substantial changes in the basis of consolidation of large groups and in the reporting sample. See the explanatory notes in Statistical Supplement 4 – Seasonally adjusted business statistics. 5 Including groups in agriculture and forestry. 6 From this point onwards: significant changes in IFRS standards, impairing comparability with previous periods.

o Assets and liabilities vis-à-vis all countries within and outside the euro area. Up to December 2000 the levels at the end of each quarter are shown, owing to revaluations, at market prices; within each quarter, however, the levels are computed on the basis of cumulative transaction values. From January 2001 all end-of-month levels are valued at market prices. **1** Mainly net claims on TARGET2 balances (according to the

respective country designation), since November 2000 also balances with non-euro area central banks within the ESCB. **2** Mainly long-term debt securities from issuers within the euro area. **3** Including estimates of currency in circulation abroad. **4** See Deutsche Bundesbank, Monthly Report, October 2014, p. 22. **5** Euro opening balance sheet of the Bundesbank as at 1 January 1999.

^{*} The effective exchange rate corresponds to the weighted external value of the currency concerned. The method of calculating the indicators of the German economy's price competitiveness is consistent with the procedure used by the ECB to compute the effective exchange rates of the euro (see Monthly Report, November 2001, pp. 50-53, May 2007, pp. 31-35 and August 2017, pp. 41-43). For more detailed information on methodology, see the ECB's Occasional Paper No 134 (www.ecb.eu). A decline in the figures implies an increase in competitiveness. 1 ECB calculations are based on the weighted averages of the changes in the bilateral exchange rates of the euro vis-à-vis the currencies of the following countries: Australia, Bulgaria, Canada, China, Croatia, Czechia, Denmark, Hong Kong, Hungary, Japan, Norway, Poland, Romania, Singapore, South Korea, Sweden, Switzerland, the United Kingdom and the United States. Where current price and wage indices were not available, estimates were used. 2 ECB calculations. Includes countries belonging to the

group EER-19 (see footnote 1) and additionally Algeria, Argentina, Brazil, Chile, Iceland, India, Indonesia, Israel, Malaysia, Mexico, Morocco, New Zealand, Philippines, Russian Federation, South Africa, Taiwan, Thailand, Turkey and Venezuela. Due to the redenomination of the Venezuelan bolívar on 20 August 2018, the spot rate from 17 August 2018 is used since then. 3 Annual and quarterly averages. 4 Euro area countries (from 2001 including Geece, from 2007 including Slovenia, from 2008 including Cyprus and Malta, from 2009 including Slovakia, from 2011 including Estonia, from 2014 including Latvia, from 2015 including Lithuania) as well as Canada, Denmark, Japan, Norway, Sweden, Switzerland, the United Kingdom and the United States. 5 Euro area countries (current composition) and countries belonging to the group EER-19. 6 Euro area countries (current composition) and countries belonging to the group EER-38 (see footnote 2).

Deutsche Bundesbank Monthly Report November 2019 84°

Overview of publications by the Deutsche Bundesbank

This overview provides information about selected recent economic and statistical publications by the Deutsche Bundesbank. Unless otherwise indicated, these publications are available in both English and German, in printed form and on the Bundesbank's website.

The publications are available free of charge from the External Communication Division. Up-to-date figures for some statistical datasets are also available on the Bundesbank's website.

Annual Report

Financial Stability Review

Monthly Report

For information on the articles published between 2000 and 2018 see the index attached to the January 2019 Monthly Report.

Monthly Report articles

December 2018

- Outlook for the German economy macroeconomic projections for 2019 and 2020 and an outlook for 2021
- German enterprises' profitability and financing in 2017
- Germany's international investment position: amount, profitability and risks of crossborder assets

January 2019

 The impact of an interest rate normalisation on the private non-financial sector in the euro area from a balance sheet perspective

- Price competitiveness in individual euro area countries: developments, drivers and the influence of labour market reforms
- Financial cycles in the euro area
- IFRS 9 from the perspective of banking supervision

February 2019

The current economic situation in Germany

March 2019

- German balance of payments in 2018
- Cash demand in the shadow economy

April 2019

- Household wealth and finances in Germany: results of the 2017 survey
- Interest rate pass-through in the low interest rate environment
- European Stability and Growth Pact: individual reform options
- Germany's debt brake: surveillance by the Stability Council

May 2019

- The current economic situation in Germany

June 2019

 Outlook for the German economy – macroeconomic projections for 2019 and 2020 and an outlook for 2021

- The European banking package revised rules in EU banking regulation
- Payment services in transition: instant payments, PSD2 and new competitors
