■ The current economic situation in Germany

Deutsche Bundesbank Monthly Report February 2024 6

Overview

Continued disinflation amid weak economic activity

Moderate growth in global economy given pronounced regional and sectoral differences

Moderate global growth

The global economy saw moderate growth in the final quarter of 2023, with regional differences in global activity persisting. In the euro area, economic output stagnated. In China, too, growth remained subdued in view of the ongoing downturn in the real estate market. By contrast, the US economy continued to expand at a brisk pace. Overall, the global economy remained solid in spite of strains such as the still relatively high energy and food prices, the tightening of monetary policy in many regions, heightened geopolitical risks and a variety of structural challenges.

Weak industrial activity in advanced economies

Global industrial output increased moderately in the fourth quarter of 2023, again driven by the emerging market economies. In the advanced economies, by contrast, output has been falling on a trend basis for more than a year, with weak industrial activity in the euro area being a key factor. Imports of goods by advanced economies declined even more sharply. According to business surveys, 2024, too, got off to a subdued start in the industrial sector and global trade. The services sector, on the other hand, appears to be gaining momentum.

Decline in inflation decelerating; risks still tilted to the upside

Energy commodity prices have seen mixed growth of late. European gas prices fell significantly against the backdrop of persistently weak euro area industrial activity, the at times mild winter temperatures and stable gas imports. Over the same period, crude oil prices rose slightly. Concerns surrounding a further escalation of the conflicts in the Middle East bolstered price developments. Recently, inflation has eased somewhat more slowly. In the group of advanced economies, the annual growth rate of consumer prices fell to 3.1% in January, and the core rate excluding energy and food sank to 3.8%. Risks with regard to future consumer price developments are likely to remain tilted to the upside for the most part. Should the conflicts in the Middle East spread to oil-producing countries, this would drive energy and consumer prices back up. Moreover, the tight labour markets in many areas and persistently high wage growth could jeopardise the continuation of the disinflationary process.

Market participants anticipating earlier and sharper key interest rate cuts

Activity in the international financial markets Expectations of was shaped by greater confidence among market players that inflation in 2024 could globally recede faster than previously anticipated. In November and December 2023, they gradually revised their previous assessment that key interest rates in many currency areas, such as the United States and the euro area, would remain at high levels for an extended period of time (higher-for-longer interest rate scenario), and instead assumed earlier and sharper key interest rate cuts. Market participants' adjustment of their expectations was mainly driven by a significant fall in energy prices and by their hopes that disinflation would progress more rapidly than previously expected. The US Federal Reserve also sent early signals that it would probably be able to lower policy rates in 2024. For instance, following the Federal Open Market Committee (FOMC) meeting in December, Fed Chair Jerome Powell expressed the view

declining inflation and sharper key interest rate cuts weighing on yields

Mixed commodity prices of late; consumer price inflation weakens further

that interest rates in the United States had probably reached their peak, and that key interest rate cuts could follow in 2024. This contributed to an appreciation of the euro against the US dollar. US inflation was slightly higher than anticipated in January, causing these expectations that key interest rates would come back down soon to weaken somewhat. In light of the continued robustness of US macro data emanating in particular from the labour market in the new year, however, investors' confidence in a soft landing for the US economy in the event of a decline in inflation increased overall. In the euro area, some members of the ECB Governing Council indicated that they regard a key interest rate cut in summer as conceivable. Against this backdrop, market participants anticipated distinctly earlier and sharper key interest rate cuts than previously assumed, given the more optimistic inflation expectations and the relatively subdued European economic outlook. Both currency areas saw a significant decline in long-term nominal and real interest rates in this setting: a development which, coupled with a sustained robust risk appetite on the part of market players, resulted in significant price gains for risky assets.

Eurosystem leaves key interest rates unchanged

At its monetary policy meetings in December

ments, it continued to hold that the key inter-

est rates had reached levels that would make a substantial contribution to the timely return of

inflation to the target. For this to happen,

2023 and January 2024, the Governing Council of the ECB left its three key interest rates unchanged. According to the Eurosystem staff's December projections for the euro area, inflation is expected to decline gradually over the course of 2024 before approaching the 2% target in 2025. In January, the Governing Council noted that the incoming data since December broadly confirmed this expectation. Overall, on the basis of its December and January assessthough, the key interest rate levels would have be maintained for a sufficiently long duration.

In December 2023, the Governing Council also decided to advance the normalisation of the Eurosystem's balance sheet. It intends to continue to reinvest, in full, the principal payments from maturing securities purchased under the pandemic emergency purchase programme (PEPP) during the first half of 2024. Over the second half of the year, it plans to reduce the PEPP portfolio by €7.5 billion per month on average, and to fully discontinue the reinvestment of redemptions by the end of 2024.

... and announces earlier end to PEPP reinvestments

Recovery in demand for shortterm loans in the euro area signals turning point in credit growth

In the final guarter of 2023, the broad monetary aggregate M3 recorded growth for the first time in five quarters. In view of the persistently low interest rate on overnight deposits, the money-holding sectors continued to shift funds into higher-yielding forms of investment. In contrast to the previous quarters, however, funds were still being channelled into higheryielding M3 holdings purely through the shifting of financial assets in the fourth quarter of 2023, which had a positive impact on monetary growth. On the output side, a marked recovery in lending to the domestic private sector and a significant increase in the net external assets of monetary financial institutions contributed to the increase in monetary growth. The anticipated end of the monetary policy tightening cycle and the expectation of falling lending rates boosted non-financial corporations' demand for short-term loans, in particular. At the same time, those banks participating in the latest round of the Bank Lending Survey (BLS) reported that they had barely tightened their lending policies any further in the final quarter of 2023.

Annual M3 growth becomes positive again and lending recovers

Monetary policy: ECB Governing Council leaves key interest rates unchanged ...

Lending in Germany weakened further

German banks' lending to domestic private sector weakens further In Germany, by contrast, lending to the domestic non-financial private sector weakened further in the fourth quarter. Lending to nonfinancial corporations stagnated. Two factors were behind this. First, there were the relatively high funding costs, which, together with subdued industrial and construction activity and the uncertain economic outlook, dampened demand for credit. The second was that the banks surveyed in the BLS once again tightened their lending policies, mainly owing to increased credit risk in light of the subdued economic situation and outlook in addition to sector-specific and firm-specific factors. Lending to households also continued to lose momentum. It was higher construction prices and high funding costs in particular which dampened demand for bank loans.

German economic output down in Q4 2023

German GDP shrinks in Q4 2023

German economic output shrank in the fourth quarter of 2023. According to the Federal Statistical Office's flash estimate, real gross domestic product (GDP) fell by a seasonally adjusted 0.3% on the quarter after virtually stagnating in the first three guarters. 1 Industry continued to be impacted by weak foreign demand. The rise in funding costs remained a drag on investment and thus on domestic demand for industrial goods and construction services. Moreover, uncertainty regarding climate and transformation policy is likely to have dampened investment. In addition, inclement weather constrained construction activity. Further pressure was placed on economic activity by the relatively high sickness rate. By contrast, lower inflation, the robust labour market and strong wage growth supported real private consumption. However, consumers probably remained cautious in their expenditure.

Labour market remains robust

The protracted economic downturn has had only a mild impact on the labour market so far. Despite a decline in economic output, employment increased slightly in the fourth quarter. Whilst unemployment reached a somewhat higher level than in the third quarter, the increase likely came to an end in the past two months. The number of job vacancies also stabilised recently, following an earlier decline. The same applies to most leading labour market indicators. Thus, there are no signs that the weak economy will cause the labour market to worsen significantly. Nor are there any indications of a sustained rise in employment and a concomitant decline in unemployment, which has recently slightly increased.

and unemployment both up slightly in Q4

Employment

At 3.6% in the fourth quarter of 2023, negotiated wages temporarily rose less sharply than in the third quarter, in which they were up by 4.7%. As in the first three quarters of 2023, large tax and social contribution-exempt inflation compensation bonuses played a key role. All in all, the pay round settlements that have been concluded thus far envisage robust wage increases for 2024 and 2025. The sharp increase in actual earnings in the previous ten quarters continued and is likely once again to have significantly exceeded the increase in negotiated wages in the fourth quarter of 2023. Trade unions' wage demands remain very high, likely partly due to previous real wage losses.

Weaker rise in negotiated wages in Q4; strong rise in actual earnings

Continued disinflation

For the first time since the end of 2020, consumer price inflation (HICP) was only marginal in the fourth quarter of 2023. On average across the months of October to December 2023, consumer prices increased by only a seasonally adjusted 0.2%, compared with +0.7%

Disinflation continued in Q4 2023

¹ Seasonal adjustment here and in the remainder of this text also includes adjustment for calendar variations, provided they can be verified and quantified. The flash estimate also included some revisions for previous quarters.

in the previous quarter. This disinflation was also clear in the year-on-year comparison, in which the headline inflation rate fell to 3.0% from a level of 5.7% in the preceding quarter. The sharp rise in energy prices in the last quarter of 2022 had a dampening effect here. The core inflation rate (HICP excluding energy and food) also dropped steeply from 5.8% to 3.6%.

Inflation fell slightly further in January: core rate unchanged

The HICP rate dropped markedly in January as well, from 3.8% to 3.1%. This was mainly due to the elimination of the base effect from the 2022 price-lowering Emergency Aid for Natural Gas Heating for End Consumers (Erdgas-Wärme-Soforthilfe), which had temporarily significantly increased the December rate. By contrast, the core inflation rate held steady at 3.4%. The inflation rate may well trend down further in the next few months. In some cases, strong fluctuations in the year-on-year rate are to be expected. This will also be due to some base effects from energy and local public transport. The main factor behind the disinflation process is the declining price dynamics in food and industrial goods. Here, weakening inflation has an impact on upstream stages. By contrast, price pressures in the services sector are likely to ease much more slowly in the coming months, partly because wage growth remains strong.

No recovery in the German economy yet

Economic output may contract once again in Q1 2024

Some stress factors are likely to remain relevant in the first quarter of 2024. Foreign industrial demand recently trended significantly downward. Consumers are likely to remain cautious in their spending. Higher funding costs may constrain domestic investment. Additionally, uncertainty regarding climate and transformation policy remains elevated. Furthermore, effects on production resulting from various strikes - including the rail and aviation strikes cannot be ruled out. There are still orders on hand in industry and construction. However, they are dwindling. Economic output is thus

likely to once again decline slightly in the first quarter of 2024. This second consecutive decline in economic output would put the German economy into a technical recession. While this would mean the ongoing period of weakness in the German economy following the start of the Russian war of aggression against Ukraine would continue, there is still no evidence of a recession in the sense of a persistent, broad-based and distinct drop in economic activity, nor is such a recession currently on the cards. In particular, the income situation and thus household consumption are likely to continue to improve in the future given the stable labour market, sharply rising wages and the declining inflation rate.

Public finances improved in 2023

Germany's public finances improved last year. The deficit and debt ratios continued to decline and were moderate by EU standards. This was related to the not due to a policy of austerity, however. In fact, the deficit fell (to 2% of GDP) because temporary measures to contain the COVID-19 pandemic were no longer necessary and were allowed to lapse. By contrast, support measures relating to the energy crisis burdened public coffers slightly more than in 2022. Weak growth in tax revenues and higher interest and military spending also drove up the deficit. The debt ratio declined to just under 65% at the end of the third quarter because price developments meant that nominal GDP continued to outpace debt.

Public finances improved in 2023 as costs COVID-19 pandemic ended and nominal GDP arowth depressed the debt ratio

Deficit set to shrink further in 2024 absent major consolidation

The deficit looks set to shrink further this year. This is because most of the support measures relating to the energy crisis have been allowed to lapse. Apart from this, however, fiscal policy looks set to become easier. In some areas, exDeficit set to shrink further in 2024 as most support measures relating to the energy crisis are allowed to lapse – otherwise, fiscal policy likely to be easier penditure is increasing, especially in the Federal Armed Forces and Germany's Climate Change and Transformation Fund. State and local government are experiencing significant growth in staff expenses, amongst other things, owing mainly to higher wages. Spending by social security funds is also growing dynamically. However, this is largely being offset by higher contribution rates to the public long-term care and health insurance schemes.

Debt brake intended to ensure sound public finances – which does not preclude stability-oriented reform

Central government will no longer make use of the escape clause in 2024 but will still run large deficits

In its 2024 budget plan, central government will, after four years, no longer make use of the debt brake escape clause. Nonetheless, it will still run large deficits; these deficits add up to just over €100 billion in the plans for central government and its off-budget entities. Onefifth of this total (€20 billion) is attributable to the Federal Armed Forces Fund, which is exempted from the debt brake. The debt brake allows cyclical deficits, deficits for the acquisition of financial assets (e.g. generational capital) and a structural deficit of 0.35% of GDP to be financed using net borrowing. These items add up to an additional two-fifths of the planned deficit. Central government will cover the remaining two-fifths using reserves.

Course virtually unchanged in 2024, resulting in considerable pressure in 2025 As compared with the first government drafts, there is a marked reduction in the deficit essentially only in terms of the support measures in relation to the energy crisis. The large deficit earmarked for the Climate and Transformation Fund remains virtually unchanged, although the Federal Constitutional Court ruling reduced the reserve by €60 billion. Overall, however, this will leave hardly any reserves on the books in 2025 for the area of relevance to the debt brake. Adjustments will consequently have to be made next year.

Effective debt brake important

Such adjustments will require difficult decisions to be made. New priorities will have to be set on the expenditure side or the revenue side will have to be adjusted. Effective fiscal rules are

especially important in such situations in order to ensure sound public finances. This does not preclude a stability-oriented reform. The Bundesbank made its own proposals for the German debt brake in the spring of 2022, and the basic considerations at that time still apply: the German budget ceilings should ensure that the debt ratio generally complies with the 60% reference value and returns to it quickly following a breach. The currently applicable borrowing limit for central government can be relaxed somewhat given this objective as long as the ceiling is not watered down in its application. In this context, it is also possible to earmark parts of the borrowing facilities for certain government expenditure items. This could be done, for example, using a capped golden rule, as discussed by the Bundesbank: up to a fixed ceiling, government net investment can be financed by borrowing. A special fund with its own credit limit in Germany's Basic Law (Grundgesetz) could be designed in such a way that it extends the leeway for a deficit in a comparable way; it would therefore not contradict these basic considerations.

EU rules should be applied in such a way that high debt ratios fall rapidly

The EU's budgetary rules, which Germany must likewise comply with, are being reformed. As things currently stand, it looks as though the reform will further expand discretionary scope in decision-making and application. Its implementation will therefore be crucial. A welcome aspect is that important fiscal anchors will remain in place. Specifically, the reference values of 3% for the deficit ratio and 60% for the debt ratio will continue to apply. And the deficit targets for a Member State are significantly stricter if it fails to meet a reference value. However, a number of aspects are problematic. This includes the fact that these budgetary limits for several years depend, not least, on assumptions which the European Commission arranges in negotiations with the respective

Implementation crucial for EU rules

Member State. At the same time, the rules are very complicated. They are likely to be very difficult to understand, both in abstract terms and in their concrete application. It is therefore to be feared that the interested public will be lost as an important pillar of oversight. In addition, the rules will start off with watered-down requirements during a transitional period. During this period, currently high debt ratios could become further entrenched or even rise. Overall, there is a danger that the new rules will make

little contribution to the objective of sound public finances as there is much leeway in how they are implemented. This makes it all the more important that the European Commission and ECOFIN translate the rules into ambitious requirements and press for Member State compliance. Such strict application of the rules would, not least, strengthen capital markets' confidence in highly indebted euro area countries.

Global and European setting

Global economic developments

Moderate global growth

The global economy saw moderate growth in the final quarter of 2023, with regional differences in global activity persisting. Economic activity stagnated in the euro area and declined again in the United Kingdom and Japan. Growth remained subdued in China, too, in light of the ongoing downturn in its real estate market. By contrast, the economy of the United States continued to see brisk expansion. Overall, the global economy remained solid in spite of strain from sources including the still relatively high prices of energy and food, the tightening of monetary policy in many regions, heightened geopolitical risks and a variety of structural challenges.

Weak industrial activity in advanced economies

Global industrial output increased moderately in the fourth quarter of 2023, again driven by the emerging market economies. In the advanced economies, by contrast, output has tended downwards for more than a year, with weak industrial activity in the euro area being a key factor. Imports of goods by advanced economies declined even more sharply. Global goods trade thus remained weak overall last year. According to business surveys, industry and global trade also got off to a subdued start in 2024. The services sector, on the other hand, appears to be gaining momentum.

Commodity prices for energy recently mixed

Commodity prices for energy have seen mixed growth in recent times. European gas prices fell significantly against the backdrop of persistently weak industrial activity in the euro area, the at times mild winter temperatures, and stable gas imports. As this report went to press, one megawatt hour of gas cost approximately €25 in Europe and thus around 40% less than at the beginning of December. Over the same period, crude oil prices rose marginally. Con-

cerns surrounding a further escalation of the conflicts in the Middle East bolstered price developments. As this report went to press, a barrel of Brent crude oil cost US\$85, a similar price to one year earlier. Forward rates, however, are indicative of falling prices over the coming months. This is consistent with the International Energy Agency's assessment that global oil markets are likely to be oversupplied in 2024.1

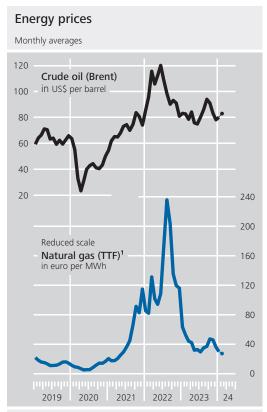

Recently, consumer price inflation has eased somewhat more slowly. Among the industrial

Deutsche Bundesbank

Consumer price inflation continuing to ease in advanced economies

countries, the year-on-year rate of consumer prices has decreased by a total of 0.3 percentage point since October 2023 to 3.1% in January, while the core rate excluding energy and food has fallen to 3.8%. Risks with regard to future consumer price developments are likely to remain largely tilted to the upside. The re-

cent obstacles to shipping in the Red Sea are unlikely to have any significant impact on consumer prices (see the box on pp. 16 f.). However, should the conflicts in the Middle East spread to the oil-producing countries, energy and consumer prices would again be driven up. Moreover, the tight labour markets in many areas and persistently high wage growth could jeopardise the continuation of the disinflationary process.

Given the brisk economic activity in the United States and the economic policy support measures in China, the staff of the International Monetary Fund (IMF) had a somewhat more optimistic outlook for the future.² In its regular update of its World Economic Outlook, the IMF staff revised its projection for global economic growth in 2024 slightly upwards to 3.1%. It kept its projection for next year unchanged at 3.2%. According to the IMF's projections, the global economy is thus likely to continue on its path of moderate growth. Furthermore, the IMF now expects inflation to decline more rapidly in the industrial countries. Inflation is likely to recede to 2.3% by the final quarter of 2024.

IMF global economic outlook remains subdued

China

Chinese economic activity remained muted at the end of 2023. According to the official estimate, China's gross domestic product (GDP) grew by just 1.0% on the quarter after price and seasonal adjustment. As a result, the government's growth target of 5% for the year as a whole was only barely exceeded. In particular, the persistent weakness in the real estate market weighed on the economy. Most recently, private consumption also lost momentum. Moderate rises in sales figures in foreign markets were only partially able to offset this. Recent economic stimuli appear to be having an initial impact. Investment in infrastructure increased considerably in recent months.

Muted economic activity in China Further easing in economic policy

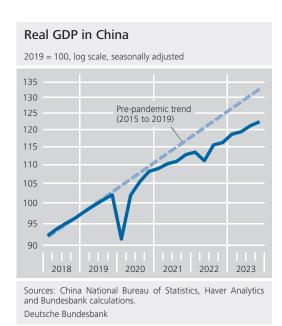

This year, the Chinese economy is likely to continue to be supported by expansionary fiscal and monetary policy. It seems that China will post a large government deficit once again.³ In addition, the People's Bank of China reactivated a liquidity provision programme for state-owned banks at the turn of the year. The minimum reserve ratio was also lowered markedly. This represented, not least, the central bank's response to consumer price inflation, which remained exceptionally sluggish. In January, consumer prices were actually noticeably below their level from the previous year. The core inflation rate excluding energy and food persisted just barely in positive territory, at 0.4%.

Other selected emerging market economies

India pauses for breath

In the final quarter of 2023, India's economy is unlikely to have maintained its high pace of growth from the preceding quarters. A dampener in industry is likely to have been a key factor in this development. In the services sector, by contrast, surveys among purchasing managers suggest that the boom continued. The good consumer sentiment was probably attributable, in part, to the fact that consumer price inflation was recently back within the target corridor set by the Reserve Bank of India. In January 2024, consumer price inflation fell to 5.1%. The core inflation rate excluding energy and food decreased to 3.5%. The central bank left its policy rate unchanged at 6.5%.

Brazil remains weak, policy rate lowered The Brazilian economy is likely to have remained weak in the final quarter of 2023. Although industrial output rose noticeably compared with the previous quarter, surveys show that growth in the services sector was once again subdued. Against this backdrop, there was a distinct decline in consumer confidence, and retail sales fell slightly in price-adjusted terms. One contributing factor to this was the still fairly strong rise in consumer prices. Following the surge in energy prices last summer, the rate of inflation fell slowly, reaching 4.5%

by January 2024. By contrast, further progress was made in reducing underlying inflation. Against this backdrop, the Central Bank of Brazil lowered its policy rate by a total of 150 basis points over three steps from the beginning of November to 11.25%.

Russia's war economy is likely to have held up quite well until recently, but appears to be increasingly reaching supply-side limits. According to initial official estimates, economic output increased by 3.6% in 2023 as a whole. In the final quarter of 2023, domestic demand is likely to have continued to benefit from the sharp expansion in defence spending. The shortage of intermediate goods in industry that prevailed during the first few months of the war appears to have largely subsided and is no longer impairing production to any significant degree. Western sanctions are being circumvented through deliveries from China and other neighbouring countries. The labour market is faced with much greater bottlenecks. In particular, the shortage of skilled workers, in conjunction with an extremely low unemployment rate of around 3%, made itself increasingly apparent. Accordingly, the already strong wage growth

Russia's economy showing signs of overheating at the end of 2023

³ China's high levels of private and government debt harbour considerable macroeconomic risks that could also spill over to the German economy. For more information, see Deutsche Bundesbank (2024).

The economic impact of shipping disruptions in the Red Sea

The maritime route through the Red Sea and the Suez Canal is one of the world's most important trade routes. Since November 2023, Yemen's Houthi rebels have been attacking cargo ships in the region. Owing to these attacks, shipping traffic on the route has fallen by around one-half. Many shipping companies are currently opting instead for the route around the southern tip of Africa, which takes 10 to 20 days longer.

As a result, global spot rates for chartering containers on cargo ships have increased. Since November 2023, the Freightos Baltic Index has almost tripled. This was mainly due to increases on the routes between Asia and Europe, which have seen freight rates climb by up to 350%. Shipping rates on other routes have risen much less strongly, however. To date, there has also been barely any reaction in terms of rates for new charters of container ships and freight rates for other forms of transport, such as bulk cargo, oil and gas tankers, or air freight.

The Global Supply Chain Pressure Index, which is compiled by the Federal Reserve Bank of New York and combines a large number of indicators, has not signalled any unusual tension in global supply chains so far.

The impact on global consumer price developments is also likely to be limited. First, despite the marked rises in prices, spot rates for container freight are still well below the peaks that were seen in the wake of the pandemic. Second, the average transport costs for container freight are likely to have risen far less sharply than spot rates, as

Diverting trade flows from the Red Sea to

the longer route around Africa is likely to exert only a small impact on global produc-

tion. Since the COVID-19 pandemic, global shipping capacity has been expanded sig-

nificantly, and international trade is, in any

case, muted due to the prevailing economic

conditions at present. This means that sup-

ply bottlenecks – such as those occasionally

being seen in Germany in connection with the escalation of the situation in the Red

Sea – are likely to subside quickly once en-

terprises adjust their procurement and pro-

duction plans. Furthermore, surveys among

purchasing managers do not yet point to

any broad-based increase in delivery times.

Spot rates for new charters of 40' containers on 12 major trade routes. 3 Start of Houthi attacks on shipping in the Red Sea.

Deutsche Bundesbank

freight capacity is often booked through

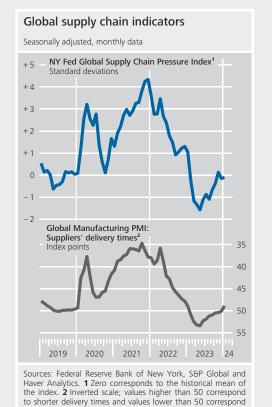

¹ The route through the Red Sea is used by around 30% of global shipping container traffic and for just under 15% of all European imports; see S&P Global (2023). It is also of great importance for the international energy trade, with 12% of the world's total seaborne-traded oil and 8% of the world's total seaborne-traded liquefied natural gas passing through the Bab el-Mandeb strait; see U.S. Energy Information Administration (2023).

² See UN Global Platform and PortWatch (2024).

longer-term contracts.³ Furthermore, goods that are not transported by container are barely affected at all. Transport costs also generally account for only small shares of the final prices of goods.⁴

The risk to consumer prices and global economic activity would be much greater if the conflicts in the Middle East were to spread to the oil-producing countries in the region. This could significantly drive up oil, gas and consumer prices as well as jeopardise the global disinflation process.

3 For example, Stumpner (2022) shows that the average transport costs for container freight rose by 64% between January 2019 and December 2021, while spot rates rose by around 700% over the same period. **4** On the basis of the World Input-Output tables, the ECB estimates that shipping costs make up less than 1% of the total cost of manufacturing output; see European Central Bank (2021).

continued to pick up. Against this backdrop, consumer price inflation rose further over recent months, climbing to 7.4% in January. Core inflation was similarly high, at 7.2%. In light of the growing supply-side bottlenecks, the Bank of Russia warned of the risks of overheating and raised its policy rate to 16%.

United States

Brisk GDP growth

The US economy saw brisk growth at the end of the year. According to initial estimates, real GDP grew by 0.8% on the quarter in seasonally adjusted terms, rounding out a year with high GDP growth overall. The main driver of this was domestic demand. Rising real incomes and the persistently robust labour market bolstered consumer sentiment among households, which increased their consumption significantly again in the autumn. In addition, a noticeable contribution to GDP growth was once again made by government consumption and investment. Pri-

vate investment in non-residential construction, which, partly owing to fiscal support, had seen strong growth during the past two years, continued to expand markedly at the end of 2023.4 In this cyclical environment, investment in machinery and equipment as well as in housing construction also increased slightly, despite unfavourable financing conditions. The upswing in the US economy could lose some momentum this year if fiscal policy is potentially more restrictive.⁵ A looming government shutdown from the beginning of March would likely have only minor macroeconomic repercussions.⁶

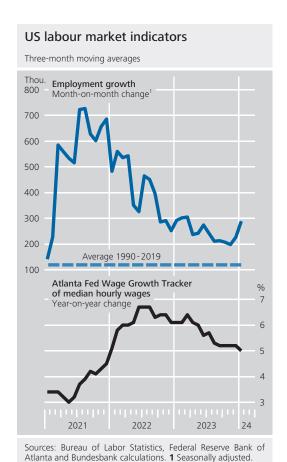

to longer delivery times.

Deutsche Bundesbank

⁴ See Deutsche Bundesbank (2023).

⁵ The Fiscal Responsibility Act of 2023 of May 2023 limits discretionary spending to a level below that of 2023; see Congressional Budget Office (2023). The preliminary budget for the current fiscal year is very close to meeting these requirements. However, a sufficient majority in Congress has not yet been found for the specific details of the budget.

⁶ Past government shutdowns only marginally dampened GDP growth. Following the end of a potential shutdown, rapid normalisation and, to a limited extent, catch-up effects would be expected. See Deutsche Bundesbank (2019).

Slower decline in consumer price inflation Against the backdrop of robust domestic activity, consumer price inflation in the United States declined more slowly in recent times. The annual rate of the consumer price index (CPI) fell only slightly in the autumn. In January, it stood at 3.1%. Core inflation excluding energy and food hardly declined at all and stood at 3.9%. Wage growth and employment growth, which both remain strong, could make the disinflation process more difficult going forward. The US Federal Reserve System therefore left its policy rate unchanged.

Japan

Deutsche Bundesbank

Economic output decreasing once again Japan's economic output contracted once again in the final quarter of 2023. According to initial estimates, GDP declined by 0.1% in seasonally and price adjusted terms over the third quarter. Above all, domestic economic activity remained listless. Against the background of persistently high inflation, there was a slight

decline in private consumption. Gross fixed capital formation continued on its downward trajectory. Exports, by contrast, picked up somewhat more briskly again. Imports also continued to rise. Despite the weak economic developments, the labour market improved. The unemployment rate fell to 2.3%. Consumer price inflation declined further to 2.6% in December. By contrast, core inflation persisted at 2.8%. In light of this, the Bank of Japan maintained its monetary policy stance.

United Kingdom

The economic downturn in the United Kingdom continued. Initial estimates show that, in the autumn, real GDP fell by 0.3% over the preceding period after seasonal adjustment. Activity in the manufacturing sector and in construction contracted to an especially noteworthy degree. Services output also declined further. This was particularly true of consumerrelated sectors such as trade. Despite the broad-based downturn, business sentiment differed from sector to sector at the end of the period under review. In particular, an improved outlook in the services sector raised the Purchasing Managers' Index for the economy as a whole above the expansion threshold. At the same time, labour market tightness eased somewhat. In line with this, there was a slowdown in wage growth. The year-on-year rate of the Harmonised Index of Consumer Prices (HICP) fell to 4.0% in January. The unemployment rate most recently remained at 5.1%. The Bank of England left its policy rate unchanged in December and January.

Declining GDP growth

Poland

According to the flash estimate, economic output in Poland remained unchanged in the autumn. On average over the year, economic growth totalled 0.2%. This was – with the exception of 2020, when the COVID-19 crisis broke out – Poland's weakest year of macro-

Upswing remains muted, inflation still persistent

economic growth since its economic transition during the 1990s. Overall, however, the economy appears to have recently overcome the burdens resulting from inflation. Industrial output rose markedly in the autumn. There was also a distinct increase in retail sales in priceadjusted terms. One reason for this was the renewed rise in household purchasing power given the declining inflation, high rate of employment, and strong wage increases. The unemployment rate fell back to 2.7% in December, and gross average wages rose by 9.6% on the year. Consumer price inflation decreased to 6.2%. By contrast, the core rate excluding energy and food persisted at 6.9%. The Polish central bank has therefore refrained from further interest rate cuts since mid-October and left its policy rate at 5.75%.

Macroeconomic trends in the euro area

Euro area economic activity persistently weak Economic activity in the euro area remained weak in the fourth quarter of 2023. According to Eurostat's flash estimate, GDP stagnated in price and seasonally adjusted terms. Economic output also remained virtually unchanged compared with the same quarter of the previous year. On an annual average, real GDP still rose slightly compared with 2022, largely driven by catch-up effects following the pandemic.

At the end of the year, the economic slow-down was broadly spread across sectors, although it continued to have the strongest impact on the manufacturing sector. Nevertheless, the labour market situation remained favourable. The unemployment rate continued to hover at an all-time low. The macroeconomic outlook is still subdued. It appears that weak global trade, geopolitical uncertainty and the impact of tighter monetary policy are continuing to weigh on activity, further delaying the anticipated economic recovery.

Once again, private consumption is likely to have expanded only moderately in the final

Real GDP in selected industrial countries

Q4 2019 = 100, seasonally and calendar adjusted, log scale

Sources: Bureau of Economic Analysis, Cabinet Office of Japan, Office for National Statistics, Statistics Poland and Bundesbank calculations.

Deutsche Bundesbank

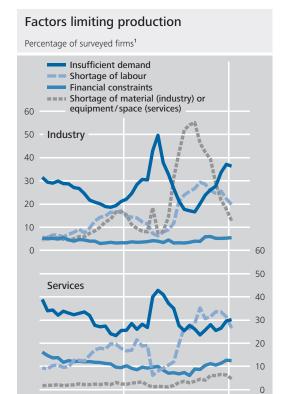

quarter. Households' purchasing power increased somewhat in the context of rising labour income and easing price pressures. Consumer confidence also brightened slightly over the course of the quarter. Despite this, retail sales fell again in price-adjusted terms, and the number of new motor vehicle registrations declined. The saving ratio was probably still significantly above its pre-pandemic level.

Private consumption still lacklustre

Investment is likely to have fallen, having stagnated in the previous quarter. Construction investment probably declined substantially. In any case, construction output continued to drop in October and November. The rise in financing costs had an impact on housing construction in particular. The number of residential building permits fell significantly by the

Investment declining

7 Excluding Ireland. For several years now, the statistical recording of investment as a whole, and of investment in intellectual property in particular, has been strongly influenced by the strategic activities of multinational enterprises in that country. See Deutsche Bundesbank (2018).

Deutsche Bundesbank

2015 16 17 18 19 20 21 22 23 2024

third quarter. Investment in machinery and equipment probably also went down. Capital goods producers' domestic sales decreased perceptibly in October and November after price adjustment. By contrast, investment in information and communication technologies and intellectual property is likely to have expanded further owing to the trend towards digitalisation.

Decline in trade in goods with third countries comes to an end In the final quarter of the year, euro area countries' exports of goods to third countries expanded again markedly for the first time in a long while. Alongside the weak euro, this was probably due to the slight increase in foreign demand. In addition, there was probably some degree of normalisation after the especially weak second and third quarters. According to balance of payments data, exports of services probably also rose. Buoyed by vibrant activity in tourism, they had performed significantly better than trade in goods over the course of the

year. Imports of goods from third countries fell significantly in the fourth quarter.

The slowdown in the manufacturing sector continued. Consumer goods production and the production of intermediate goods fell markedly. Energy-dependent sectors such as the chemical industry showed the first signs of a bottoming-out in this regard, and motor vehicle production also recovered somewhat. European Commission surveys suggest that the sluggish industrial activity was due mainly to a lack of domestic and foreign demand. Enterprises were also concerned about their competitiveness. By contrast, factors limiting production owing to a shortage of materials and labour have become less relevant in the meantime. Above and beyond that, price pressures at the producer level eased considerably. Producer and import prices fell significantly on the year, mainly owing to falling energy prices but also to declining prices for intermediate goods. Capacity utilisation continued to decrease between October and January, standing slightly below its long-term average.

... and further deterioration in services

Weak industrial

activity ...

The services sector continued to deteriorate in the fourth quarter. Only the information and communication sector is likely to have continued to expand, albeit at a slower pace. By contrast, activity in the hotel and restaurant sector and in some business-related services appears to have declined after showing strong growth in the preceding quarters. According to the European Commission's surveys, demand shortages played an increasingly important role here, too. In addition, a growing number of enterprises cited financial reasons as a factor limiting their business activities.

In most euro area Member States, the economic situation remained subdued in the fourth quarter. Even so, economic growth increased markedly in several Member States. The main factors that produced this mixed picture were differences in households' purchasing power and the strength of the stimulus Considerable differences between Member States provided by public infrastructure projects. Moreover, the lull in the manufacturing sector affected different countries to varying degrees. It had a particularly strong impact in Germany.⁸

French economy stagnates again

According to a preliminary estimate, real GDP in France stagnated again in the fourth quarter. The French economy thus moved sideways in the second half of 2023. Nonetheless, growth for 2023 as a whole comes to 0.9%. In the fourth quarter, domestic final demand, in particular, fell off markedly compared with the previous quarter. Investment was significantly curtailed and private consumption also declined somewhat. Imports were down substantially. By contrast, exports remained broadly unchanged following the decline in the previous quarter. Inventory changes made a significantly negative contribution to growth. On the output side, industrial production increased somewhat, while service providers' activity stagnated. The construction sector recorded another substantial decline.

Slightly stronger growth in Italy

Macroeconomic activity in Italy increased slightly at the end of 2023. According to preliminary data, real GDP increased by 0.2% after rising by 0.1% in the previous quarter. Real GDP grew by 0.7% for the year as a whole. Exports, which are likely to have expanded markedly, provided the main impetus in the final quarter. Imports probably declined, as they had done in the previous quarter. Weak domestic demand weighed on economic activity, by contrast. Investment activity is likely to have fallen again, partly as a result of tighter financing conditions, and private consumption will probably only have stagnated despite the easing of inflationary pressures. On the output side, both industrial production and service providers' activity picked up somewhat.

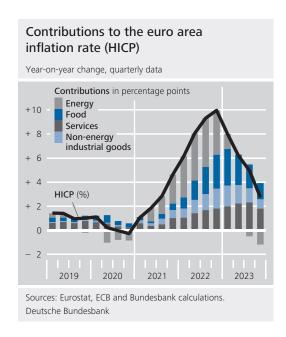

Economic activity in Spain continues upward trend In Spain, economic activity, which has been expanding for several quarters now, remained brisk in the fourth quarter. According to a preliminary estimate, real GDP rose by 0.6% on the quarter. Economic output rose by 2.5% in 2023 as a whole. Growth was driven by a slight

increase in private consumption and a surge in exports, particularly of goods. By contrast, investment activity fell markedly in price-adjusted terms, with machinery and equipment recording a much steeper decline than construction. On the output side, activity in the manufacturing, information and communication services and business services sectors increased significantly.

Portugal and Cyprus also posted strong growth in economic output, while Belgium and Slovakia saw another moderate increase. In the

Marked differences between smaller euro area countries, too Netherlands and Austria, real GDP picked up again somewhat after a prolonged period of weakness. The economic situation in the Baltic countries and Finland remained tense, although Latvia, at least, saw economic output rise again somewhat. In Ireland, real GDP fell for the fifth consecutive quarter.

Labour market situation remains upbeat

The labour market situation in the euro area remained upbeat in the fourth quarter of 2023. Unemployment stayed at its low of 6.4%, and the number of people in employment rose again markedly. So far, the weak economy has mainly been reflected in a slight deterioration in the employment outlook. According to European Commission surveys, labour shortages in industry and among service providers eased but remained high by long-term standards. This is consistent with the fact that the share of firms that employ workers although they do not need them directly is markedly higher than its long-term average.9 Wage growth is likely to have been comparatively high in the fourth quarter, too, at between 4% and 5% on the year. Given stagnating labour productivity, wage cost pressures thus remained considerable.

In the final quarter of 2023, consumer prices in the euro area rose only slightly. The HICP increased by a seasonally adjusted 0.3% on the quarter, its most modest increase since 2020. One key factor here was the decline in energy prices, which had still been on the rise in the third quarter. Inflation also eased significantly in other areas, but remained noticeable for food and services.

Year-on-year price dynamics in the euro area remained high, although the HICP rate almost halved compared with the third guarter, at 2.7%. Around one-third of the decline is attributable to reductions in energy prices. At 9.8%, the annual growth rate fell even deeper into negative territory. By contrast, prices for food and other goods still rose by around 7% and 2.9% on the year, respectively. However, inflation continued to recede here too, partly because the rise in prices at the upstream stages came to a halt. Inflation also declined in the services sector, but remained high at just over 4% compared to the previous year. Ongoing wage pressures contributed to this. The core inflation rate excluding energy and food therefore proved much more persistent than the headline rate, falling merely from 5.1% to 3.7%. The HICP rate averaged 5.4% in 2023 following 8.4% in 2022. The core rate, by contrast, climbed from 3.9% to 4.9%.

Eurostat's estimate put euro area inflation at 2.8% in January 2024, 0.1 percentage point lower than in December. Data on short-term movements in key components of the HICP were not yet publicly available at that time. 10 However, preliminary data for the sub-indices suggest that the annual growth rates for processed food and non-energy industrial goods fell slightly. By contrast, the annual inflation rate remained unchanged for services, but rose slightly for unprocessed food and energy. Like the headline rate, the core rate, at 3.3%, was 0.1 percentage point lower than in the previous month. The disinflation process could lose a lit-

Inflation rate excluding energy still high

According to the flash estimate, price dynamics in January remained high for services, in particular

⁹ According to the European Commission's new labour hoarding indicator. For technical details, see European Commission (2023).

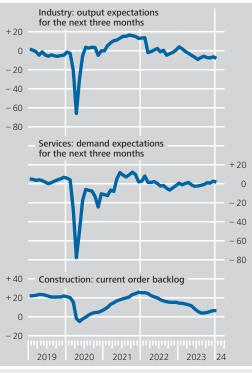

¹⁰ The HICP weights for 2024 will only be published alongside the final January figures.

tle momentum over the next few months. Energy prices probably moved sideways and consumer goods prices did not fall further at the upstream stages. Moreover, the high wage growth is likely to continue for a while, which should be particularly noticeable in the services sector.

No fundamental cyclical improvement in the short term The cyclical weakness in the euro area is likely to continue in the current quarter. Leading indicators promise only marginal economic growth at best. According to European Commission surveys, sentiment in the manufacturing sector trended sideways, remaining significantly below its long-term average. In the case of service providers, it recently improved somewhat, slightly exceeding the long-term average once more in January. Consumer confidence remained depressed despite some improvement. Nevertheless, aggregate activity is likely to pick up over the course of the year. The dampening effect of the tighter monetary policy stance should gradually diminish, with gains in purchasing power stimulating private consumption. Global trade is likely to gather momentum as demand for industrial goods picks up again in the advanced economies. However, this outlook is contingent on a lack of new disruptions, for example those stemming from heightened

Sentiment indicators for the euro area

Deutsche Bundesbank

geopolitical tensions. In this respect, future developments remain highly uncertain at the moment; this in itself is a factor curbing economic activity.

Monetary policy and banking business

Monetary policy and money market developments

ECB Governing Council leaves key interest rates unchanged

At its monetary policy meetings in December 2023 and January 2024, the ECB Governing Council decided to keep its three key interest rates unchanged. The interest rate on the deposit facility, which is currently the most significant for money market rates, thus remains at 4%. The interest rates on the main refinancing operations and the marginal lending facility stand at 4.5% and 4.75%, respectively. In December, the Governing Council noted that, whilst inflation had fallen in the preceding months, it would be likely to pick up again temporarily in the near term. According to the December projections for the euro area, inflation is expected to decline gradually over the course of 2024 before approaching the 2% target in 2025. Overall, the projections now see headline inflation averaging 2.7% in 2024, 2.1% in 2025 and 1.9% in 2026. Compared with the projections from September 2023, this represents a downward revision for 2024. Underlying inflation also continued to decline. However, domestic price pressures remained elevated, primarily owing to strong growth in unit labour costs. At its meeting in January, the ECB Governing Council noted that the incoming data since December broadly confirmed its assessment of the medium-term inflation outlook

Future interest rate decisions continue to follow datadependent approach On the basis of its assessments from December and January, the ECB Governing Council continued to hold that the key interest rates are at levels that would make a substantial contribution to the timely return of inflation to the target. For this to happen, however, the key interest rate levels would have be maintained for a sufficiently long duration. The Governing Council will continue to follow a data-dependent approach to determining the appropriate level and duration of restriction. In particular, interest rate decisions will continue to be based on

assessments of the inflation outlook, the dynamics of underlying inflation, and the strength of monetary policy transmission.

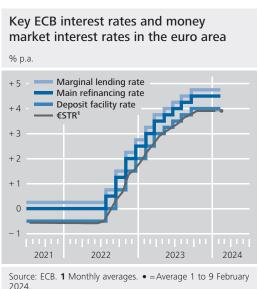

In December 2023, the ECB Governing Council also decided to advance the normalisation of the Eurosystem's balance sheet. It intends to continue to reinvest, in full, the principal payments from maturing securities purchased under the pandemic emergency purchase programme (PEPP) during the first half of 2024. Over the second half of the year, it plans to reduce the PEPP portfolio by €7.5 billion per month on average and to fully discontinue the reinvestment of redemptions by the end of 2024.

ECB Governing Council announces reduction in PEPP reinvestments

The euro short-term rate (€STR) has remained unchanged overall in the reporting period since mid-November, as no further interest rate hikes have been agreed. It stood most recently at 3.907% and thus remained around 10 basis points below the deposit facility rate.

€STR unchanged overall

Across the board, market participants continue to believe that the interest rate on the deposit facility has peaked at 4%. The Eurosystem's Survey of Monetary Analysts conducted ahead

Money market management and liquidity needs

In the reporting period from 1 November 2023 to 30 January 2024,¹ excess liquidity in the Eurosystem decreased by a total of €91.9 billion to an average of €3,495.5 billion, though it remained at a high level. The decline was driven mainly by voluntary early repayments and maturing securities under the third series of targeted longer-term refinancing operations (TLTRO III) as well as the decrease in the outstanding volume under the asset purchase programmes.

Compared with the sixth reserve maintenance period of 2023 (September-October 2023), liquidity needs in the euro area stemming from autonomous factors (see the table below) fell by €106.4 billion to an average of €1,433.1 billion in the eighth reserve maintenance period of 2023 (December 2023-January 2024). Without this liquidity-providing effect, excess liquidity

would have contracted even more sharply. On the one hand, the decline in government deposits of €54.3 billion (of which €8.8 billion in Germany) was the main factor behind the drop in liquidity needs. On the other hand, the combined total of net foreign assets and other factors, which are considered together owing to liquidityneutral valuation effects, rose by €54.1 billion. In this context, the liquidity-absorbing effect stemming from other factors decreased as a result of a decline in the nonmonetary policy deposits contained within these factors (-€18.1 billion) in the Eurosystem over the entire period under review. However, in Germany in particular, there

Deutsche Bundesbank

¹ Here, the averages of the eighth reserve maintenance period of 2023 (December 2023-January 2024) are compared with the averages of the sixth reserve maintenance period of 2023 (September-October 2023)

was an increase in deposits held by foreign central banks in December 2023, which is common at the end of the year. On account of seasonal factors, the volume of banknotes in circulation in the Eurosystem rose slightly by €2.0 billion to €1,556.8 billion, absorbing liquidity. In Germany, net banknote issuance increased by €5.4 billion to €918.2 billion. Over the period under review, the minimum reserve requirement in the Eurosystem fell by €2.2 billion to €162.3 billion, marginally decreasing the need for central bank liquidity. Since 20 September 2023, minimum reserves held with the Eurosystem have been remunerated at 0.00% instead of at the deposit facility rate. In Germany, the reserve requirement remained almost unchanged at €44.7 billion. Of the central bank liquidity of euro area banks, 95% (96% in Germany) was held in the deposit facility.

The average outstanding tender volume in the euro area decreased by €119.4 billion to €404.2 billion during the reporting period. The maturity date for TLTRO III.6 and a voluntary early repayment option for TLTRO III.7-10 fell within the period under review, on 20 December 2023. A total of €98.9 billion matured and was repaid on that date. The volume under the regular main refinancing operations and threemonth tenders remained low overall. However, there were temporary rises in the volume under the main tender at the end of TLTRO III.6 and, in particular, at the turn of the year. In Germany, the average outstanding volume of all refinancing operations fell by €27.1 billion to €70.5 billion in the period under review. This was partly due to maturities and voluntary early repayments under the TLTRO III operations in December, amounting to €19.4 billion. German banks' share in the outstanding volume of Eurosystem refinancing operations thus came to around 17%, which was roughly 2 percent-

Deutsche Bundesbank

age points lower than in the sixth reserve maintenance period of 2023.

The decrease in the asset purchase programme (APP) portfolio had the greatest impact on the overall amount of securities held for monetary policy purposes. Since 1 July 2023, reinvestments under the APP have been discontinued, while reinvestment in the pandemic emergency purchase programme (PEPP) has remained unchanged. Overall, holdings of monetary policy assets decreased by €81.1 billion in the period under review. As at 9 February 2024, the balance sheet holdings of the asset pur-

Deutsche Bundesbank

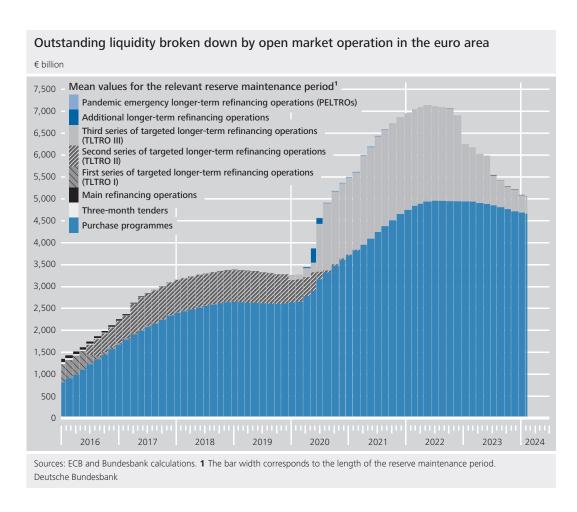

chase programmes amounted to €4,663.9 billion (see the table on p. 27) and thus maintained a high level.2 92% of the liquidity provided by monetary policy instruments stemmed from purchase programmes and only 8% from refinancing operations.

As in the sixth reserve maintenance period of 2023, the unsecured euro short-term rate (€STR) recorded an average of 3.90%. The average volume of €STR was equally stable, at €59.9 billion in the seventh reserve maintenance period of 2023 (November-December 2023) and at €58.3 billion in the eighth, breaking the slight downward trend

observed in the previous reference periods. With a decline of 1.1 basis points at end-November, the impact on the €STR fixing was weaker than at the end of previous months. At 1.8 basis points, the end-of-year effect on €STR was comparable to previous years. Transaction volumes were comparatively high for the end of a year, at €44.0 billion, despite a marked day-on-day decline of €13.7 billion.

During the period under review, the spread over the deposit facility rate continued to decline for secured overnight transactions on Eurex Repo's GC Pooling trading platform amid increasing transaction volumes. ECB basket transactions were traded at averages of 3.94% and 3.95%, respectively, in the seventh and eighth reserve maintenance periods of 2023. In the ECB EXTended basket, which has a broader selection of securities with lower rating requirements for concluding repo transactions, trading took place at an average rate of 3.97% during the period under review. The gap between the two rates thus narrowed from 3 basis points to 2 basis points in the eighth reserve maintenance period of 2023. Once again, turnover in both collateral baskets was up on the previous reporting period (ECB basket: €6.6 billion, ECB EXTended basket: €5.6 billion). Both the increase in rates and in trading volumes took place in the eighth reserve maintenance period of 2023, despite the usual decline in turnover and interest rates during public holidays and at year-end.

² In addition to the termination of reinvestments under the APP, holdings were also shaped by revaluations and the smoothing of reinvestments under the PEPP.

Money market forward rates and surveys indicate expected interest rate cuts in 2024 of the January meeting, showed that participants expected to see a median initial rate cut of 25 basis points in June. For 2024 as a whole, they expect interest rate cuts totalling 100 basis points. Money market forward rates, too, are pricing in significant interest rate cuts and go beyond the expectations indicated in the survey: an initial cut of 25 basis points is partly priced in for April at present, and, for 2024, the money market forward curve shows expected interest rate cuts of more than 100 basis points.

Decline in asset holdings continues Monetary policy asset holdings have continued to decline overall during the reporting period since mid-November 2023. This development is attributable to assets under the asset purchase programme (APP) that are maturing and not being reinvested. On 9 February, the stock of APP assets held by the Eurosystem amounted to €2,989.9 billion (a breakdown of these holdings by individual asset purchase programme can be found on pp. 26 ff.). Asset holdings reported under the pandemic emergency pur-

chase programme (PEPP) came to €1,671.6 billion on the same day.

Excess liquidity has contracted since mid-November, falling by around €37 billion. At last count, it came to €3,511 billion. Additional final maturities and voluntary repayments under the third series of targeted longer-term refinancing operations (TLTRO III) contributed to this decline. Maturing assets under the APP also caused excess liquidity to shrink further. In addition, excess liquidity was influenced by the development of the autonomous factors, too, which fluctuated particularly over the turn of the year (see the box on pp. 26 ff.).

Deutsche Bundesbank

in the wake of monetary policy tightening. Its annual growth rate, which had stood at -1.2% at the end of September, increased to 0.1% by the end of 2023 (see the adjacent chart). In view of the persistently high interest rate differential between highly liquid deposits and other forms of investment, the money-holding sectors continued to shift funds into higheryielding investments. In contrast to the previous quarters, however, beyond this pure shifting of financial assets, funds were channelled into higher-interest-bearing M3 holdings in the fourth quarter of 2023, which had a positive impact on monetary growth. On the output side, a marked recovery in lending to the domestic private sector and a significant increase in the net external assets of the monetary financial institutions (MFI) sector contributed to the increase in monetary growth. The anticipated end of the monetary policy tightening cycle and the expectation of falling lending rates boosted non-financial corporations' demand for short-term loans, in particular. At the same time, the banks participating in the latest round of the Bank Lending Survey (BLS) reported having barely tightened their lending policies any further in the final quarter of 2023.

In terms of money holdings, the shifts towards higher-interest-bearing M3 holdings continued during the fourth quarter of 2023 (see the table on p. 31). Households in particular and, to a lesser extent, non-financial corporations further reduced their stocks of overnight deposits in view of their continued very low interest rates. At the same time, however, they expanded their short-term time deposits to an even greater extent. In addition, demand also increased for marketable instruments included in M3, which are held primarily by financial corporations. Overall, these adjustments resulted in M3 recording a net inflow for the first time since the summer of 2022. This was partly due to the fact that the yield spread between assets outside of M3 and the higher-interest-bearing M3 holdings narrowed as a result of the decline in capital market yields.

Ongoing reduction of overnight deposits in favour of short-term time deposits

Investment also in non-M3 assets

In addition to the increase in stocks of higher-interest-bearing M3 investments, the money-holding sector also continued to invest in non-M3 forms of investment. Alongside long-term savings deposits, demand was particularly strong for long-term bank debt securities, the yields of which declined somewhat, but nevertheless remained attractive. Both forms of financing gained in importance for banks in the course of the gradual repayment of TLTRO III loans.

Monetary growth supported by continued rise in current account balance On the counterparts side, the largest contribution to monetary growth in the fourth quarter of 2023 was made by the net external position. According to the information currently available from the balance of payments statistics, this was mainly due to a further increase in the positive euro area current account balance. On the one hand, exports continued to grow, particularly to the United States and the United Kingdom. On the other hand, lower commodity prices led to a decline in imports in nominal terms. By contrast, non-banks' securities transactions with non-residents had a slight dampening effect on monetary growth on balance.

In the fourth quarter, the MFI sector's lending to domestic non-banks also showed a marked recovery over the weak preceding quarters. This was also especially true of banks' lending business with non-financial corporations, which grew moderately on balance. Among the four largest euro area Member States, banks in France once again recorded the strongest net growth, while the contribution made by German banks was only marginally positive. Lending by banks in Italy and Spain stagnated as well. In both countries, however, loans to nonfinancial corporations had declined during the preceding quarters - sharply, in some cases meaning that credit growth appeared to recover in net terms here, too. For the euro area as a whole, the annual growth rate of loans to enterprises, which had stood at 0.2% in the previous quarter, rose to 0.4% by the end of the year.

The expansion in lending mainly affected short-term loans with maturities of up to one year. Longer-term loans recorded significantly smaller inflows. The shift in demand towards short-term loans was probably enterprises' response to the mounting signs of a turning point in euro area financing conditions. Against the backdrop of waning inflation dynamics, lending rates declined slightly in November and December for the first time since the start of the rate hiking cycle. Yields in the capital market even declined markedly as expectations of rate cuts in 2024 grew. Given the expectation of lending rates falling further, it thus seemed at-

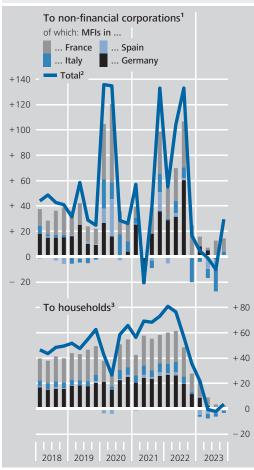

in lending overall, particularly due to a significant increase in loans to enterprises

tractive for enterprises to borrow additional funds initially for just a shorter period of time.

This is consistent with the fact that the euro area banks surveyed by the BLS reported a further net decline in demand for loans to enterprises in the fourth quarter of 2023, particularly for longer-term loans. However, the decrease in demand was smaller than it had been in the three previous rounds of the survey. For the first quarter of 2024, the surveyed banks are not expecting a further fall in credit demand for the first time since mid-2022. According to the BLS, credit standards for loans to enterprises were tightened on balance by only a few

banks in the fourth quarter. This tightening was the weakest seen in two years and was also less than banks had planned in the previous quarter. Over the last two rounds of the survey, tightening particularly affected the real estate sector and primarily loans for commercial real estate. However, it can be assumed that the significant tightening of credit standards seen in some cases over the preceding quarters will continue to dampen lending overall.

Bank lending to households continued to stagnate in the fourth quarter. Among the four largest euro area Member States, bank lending to households increased in both Germany and France, but was once again weaker than in the previous quarter. Banks in Italy and Spain again recorded net outflows from their loan portfolios, albeit to a lesser extent compared with the previous quarter. On balance, the euro area saw a marginal increase in lending, which was largely attributable to consumer credit. By contrast, the segment of loans for house purchase, which is much more significant in terms of holdings, made virtually no contribution to the aggregate in the reporting guarter. 1 Loans categorised as "other lending" (including loans to sole proprietorships) also decreased markedly again. On aggregate, the annual growth rate of loans to households fell further to 0.3% by the end of the year.

Stagnating lending to households, especially in the case of loans for house purchase

The weak development of loans for house purchase is consistent with the fact that the banks surveyed by the BLS reported a further decline in demand for this loan category in the fourth quarter. However, this decline was smaller than in the five previous quarters. According to the surveyed banks, the main reasons for the lower funding needs among households were the rise

BLS indicates demand for housing loans down again ...

Barely any further tightening of credit standards for loans to enterprises

1 For the components of loans to households (loans for house purchase, consumer credit, and other lending), data adjusted for loan sales and securitisation (as has been the case for the aggregate since January 2003) are available since January 2022. The seasonally adjusted original series of loans for house purchase, which rose significantly in the quarter under review, recorded a very small outflow after adjustment for such securitisation effects (however, these effects have not been seasonally adjusted).

in interest rates, the decline in consumer confidence, the bleaker outlook in the housing market, and the prospective development of house prices.

... and credit standards barely tightened further Banks' lending policies are also likely to have further dampened credit growth. According to banks, credit standards for loans for house purchase were barely tightened any further on balance. However, as in all loan categories, the restrictive adjustments over the past one and a half years probably continued to have an impact on lending. As in previous rounds of the survey, banks cited increased credit risk, particularly with regard to economic conditions, as well as the subdued economic outlook, the bleaker outlook in the housing market, and the prospective development of house prices as the key reasons for the tightening.

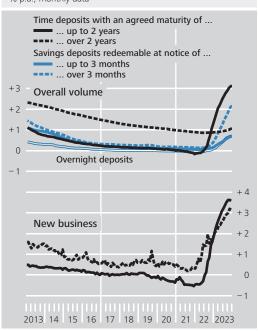

German banks' deposit and lending business with domestic customers

Deposit business up noticeably

Amid declining capital market yields, German banks' deposit business with domestic customers increased markedly in the fourth quarter of 2023, much like in the euro area as a whole. In Germany, too, mainly short-term time deposits were built up, with the largest contribution coming from households, which increased their balances to an even greater extent than in the previous quarters. At the same time, households continued to reduce their holdings of overnight deposits and short-term savings deposits. The main reason behind this development is likely to have been the persistently high yield spread between these types of deposit and short-term time deposits remunerated at close to market rates (see the chart above). In addition, households also increased their holdings of longer-term bank deposits, the remuneration of which became somewhat more attractive than that of other forms of investment. Non-financial corporations likewise continued to build up short-term time deposits in the

Deutsche Bundesbank

fourth quarter of 2023, albeit to a lesser extent than in the previous quarter.

In contrast to the developments in the euro area as a whole, German banks' lending business with domestic customers weakened markedly again in the final quarter of 2023. This was due, first, to the fact that lending to the domestic private sector recorded a net outflow, which was mainly attributable to financial corporations distinctly scaling back their debt with domestic banks. Second, loans to the public sector recorded weaker inflows than in the previous quarter.

Lending business with non-banks weakens again

By contrast, lending to non-financial corporations moved almost sideways in the final quarter of 2023. Developments in the individual maturity segments were once again heterogeneous. Unlike in the euro area, non-financial corporations further reduced their short-term bank loans on balance. By contrast, longerterm loans increased markedly in net terms.

Lending to enterprises negative, but different developments in individual maturities

Deutsche Bundesbank

The shift in loans demand towards longer maturities was encouraged by banks' rate-setting behaviour: banks in Germany lowered their interest rates on longer-term loans perceptibly over the course of the quarter and raised interest rates on short-term loans again slightly.

The overall weak growth in loans to non-financial corporations is likely to be a reflection of several factors. First, relatively high financing costs as well as subdued industrial and construction activity in addition to the uncertain economic outlook continued to dampen credit demand. The banks surveyed as part of the BLS thus reported that credit demand had declined again in net terms in the fourth quarter of 2023, albeit less sharply than in the previous quarter. The banks mainly attributed this fall in demand to the decline in financing needs for fixed investment and to the rise in the interest rate level.

At the same time, banks' tighter lending policies are also likely to be having a dampening impact on lending. Although the banks surveyed by the BLS barely tightened their credit standards for corporate lending any further in net terms during the reporting quarter, the overall considerable tightening from the previous guarters is likely to be continuing to have a dampening effect on lending. In addition, the surveyed banks once again made their credit terms and conditions more restrictive overall. They mainly attributed the restrictive nature of their lending policies to their perception of elevated credit risk, given the subdued economic situation and economic outlook, as well as to industry-specific and firm-specific factors.

barely tightened, but credit terms and conditions more restrictive

Credit standards

Banks' lending business with domestic households also stagnated in the fourth quarter. This was because households once again slightly reduced their demand for loans for house purchase on balance and, at the same time, made noticeable repayments on their consumer credit and other borrowing. The weak demand in this loan category continues to be driven by high financing costs and elevated construction prices. However, according to the MFI interest rate statistics, interest rates on long-term loans for house purchase fell again for the first time at the end of the year and stood at 3.65% at the end of December.

Growth in loans for house purchase continued to weaken

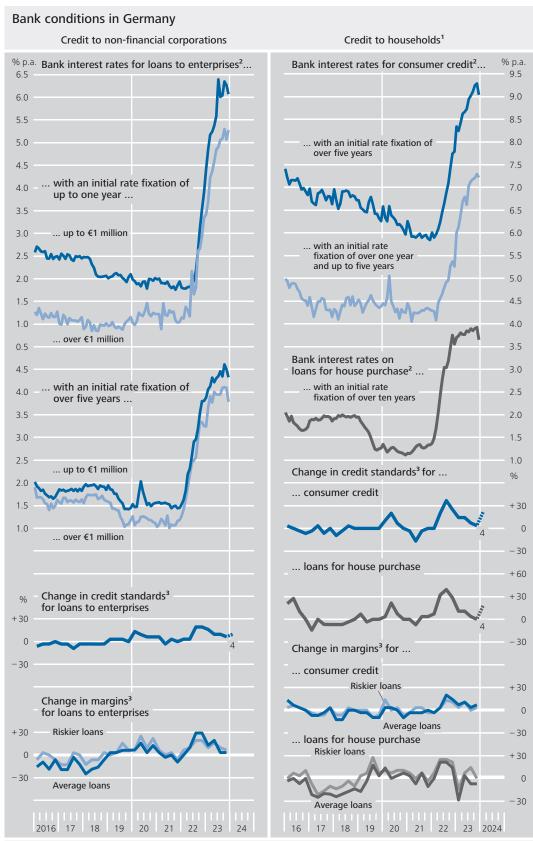

By contrast, banks' lending policies did not have any additional restrictive effect in the fourth quarter. Contrary to what banks had planned, credit standards for loans to households for house purchase remained unchanged, and credit terms and conditions were even eased somewhat. Banks attributed the easing of terms and conditions primarily to the intense competition.

Financing conditions for housing loans less restrictive overall

By contrast, according to the BLS, credit standards for consumer credit and other lending to households were tightened slightly in the fourth quarter of 2023. At the same time, the banks surveyed by the BLS reported a slight reduction in demand, mainly on account of a de-

cline in households' propensity to purchase. The upward trend in financing costs for consumer credit, which was already comparatively expensive, came to an end.

Given the conditions in financial markets, German banks reported virtually no change in their

funding situations compared with the previous quarter. Only their access to deposits deteriorated.

> Banks expect to tighten their credit standards due to supervisory and regulatory requirements

Deterioration in

German banks

access to

deposits

The Eurosystem's key interest rate hikes have had, overall, a positive impact on banks' profitability over the past six months. They were a drag on non-interest income, but net interest income improved markedly. For the next six months, banks expect the key interest rate decisions to have a far smaller impact on their profitability than in the previous six months. Banks responded to new regulatory and supervisory activities by continuing to strengthen their capital positions in 2023. Over the next 12 months, banks expect risk-weighted assets to increase, especially for average-risk loans. In addition, they anticipate that changes in supervisory and regulatory requirements will necessitate a tightening of their credit standards across all loan categories. For banks under national supervision in Germany, this will probably reflect the implementation of the seventh amendment to the Minimum Requirements for Risk Management (MaRisk). Since 1 January 2024, this has required mandatory compliance with additional and, in some cases, stricter requirements for loan origination and monitoring. It also includes guidelines on sustainability. For banks supervised by the Single Supervisory Mechanism (SSM), the ECB has set out equivalent guidelines.

The banks do not see developments in excess liquidity held with the Eurosystem as having had any meaningful impact on their lending over the past six months. By their account, that is also unlikely to change in the next six months.

Developments in excess liquidity have no meaningful impact on lendina

Financial markets

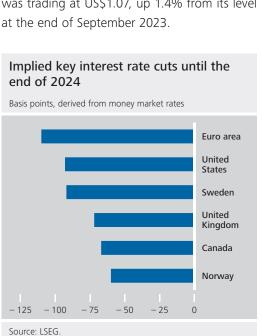

Financial market environment

Expectations of declining inflation and sharper key interest rate cuts weigh on yields

Activity in the international financial markets was shaped by greater confidence among market players that inflation in 2024 could globally recede faster than previously anticipated. In November and December 2023, they gradually revised their previous assessment that key interest rates in many currency areas, such as the United States and the euro area, would remain at high levels for an extended period of time ("higher-for-longer" interest rate scenario), and instead assumed earlier and sharper key interest rate cuts. Market participants' adjustment of their expectations was mainly driven by a significant fall in energy prices and by their hopes that disinflation would progress more rapidly than previously expected. The US Federal Reserve also sent early signals that it would probably be able to lower policy rates in 2024. Following the Federal Open Market Committee (FOMC) meeting in December, Fed Chair Jerome Powell expressed the view that interest rates in the United States had reached their peak, and that key interest rate cuts could follow in 2024. This contributed to an appreciation of the euro against the US dollar. US inflation was somewhat higher than expected in January, leading to a slight weakening of expectations of a cut in key interest rates. However, in view of the continued robustness of US macroeconomic data, emanating in particular from the labour market in the new year, investors' confidence in a "soft landing" of the US economy, concurrent with a decline in inflation, grew. In the euro area, some members of the ECB Governing Council indicated that they regard a cut in key interest rates in the summer as conceivable. Given the more optimistic inflation expectations and a relatively subdued economic outlook in the euro area, market participants anticipated significantly earlier and sharper key interest rate cuts than before. Both currency areas saw a significant decline in longterm nominal and real interest rates in this setting – a development which, coupled with a sustained robust risk appetite on the part of market players, resulted in significant price gains for risky assets.

Exchange rates

The euro appreciated against the US dollar on balance from the end of the third quarter of 2023. The main driver of this appreciation was firming expectations of a turnaround in US monetary policy. This view put pressure on the US dollar despite the expectation that key interest rates would also be cut in the euro area. While, taken in isolation, the relatively stronger economic outlook for the United States supported the US currency in 2024 – for instance, when surprisingly good gross domestic product (GDP) and labour market figures were published - exchange rate developments were dominated by the expectation of an interest rate reversal in the United States in the near future, causing the euro to appreciate overall. At the end of the reporting period, the euro was trading at US\$1.07, up 1.4% from its level

Deutsche Bundesbank

Euro up against the US dollar ...

Deutsche Bundesbank

... and against the yen ...

The euro also appreciated against the yen on balance. This currency pair's exchange rate was also largely driven by expectations regarding monetary policy in the respective currency areas. The Japanese currency has been under pressure since the tightening cycle began in the euro area, as the Bank of Japan has maintained a negative interest rate policy despite inflation rates also rising in Japan. The euro even reached a 15-year high of ¥164 in mid-November. The single currency did not weaken against the yen until the aforementioned expectations of impending interest rate cuts emerged in the euro area and comments made by the Bank of Japan's Governor Kazuo Ueda at the beginning

of December were interpreted by market participants to mean that Japan could be on the verge of normalising its monetary policy. However, a severe earthquake in western Japan at the beginning of the year contributed to market participants lowering their expectations of monetary tightening in the near future. As a result, the euro appreciated again and stood at ¥161 at the end of the reporting period. This represents a net gain of 2.0% since the end of September last year.

The euro depreciated slightly against the pound sterling. As against the US dollar and the yen, the euro depreciated markedly against the UK currency at the end of November as participants in the foreign exchange market priced in the prospect of interest rate cuts for the euro area in the near future. However, the euro received temporary support from a set of economic data published for the United Kingdom in December showing weak growth and surprisingly low inflation. This fuelled the expectation that the Bank of England could also cut interest rates sooner than previously assumed. At the end of the period under review, the euro stood at £0.86, which was 1.0% lower than at the end of the third quarter of 2023.

... but down against the pound sterling

On a weighted average against the currencies of 18 major trading partners, the euro was virtually unchanged (-0.1%). While it was primarily supported by its gains against the US dollar, the currency depreciated against the złoty and the Swiss franc on balance.

Euro virtually unchanged in effective terms

Securities markets

Bond market

With the exception of Japan, nominal sovereign bond yields declined significantly in the major currency areas from the end of the third quarter of 2023. An important reason for this was also the change in market participants' expectations regarding interest rate developments. In this environment, yields on ten-year

Yields on tenyear sovereign bonds down in euro area and United States US Treasuries fell significantly to 4.3% over the reporting period. The GDP-weighted yield on ten-year euro area bonds fell even more sharply to 2.9%. This comparatively steep decline reflects, on the one hand, expectations of a less restrictive monetary policy and the gloomier economic picture in the euro area. On the other, spillover effects from the United States are likely to have played a role in this sharp decrease in yields, too. In any case, this is what a model-based analysis suggests that breaks down interest rate movements into the historical contributions of individual shocks.

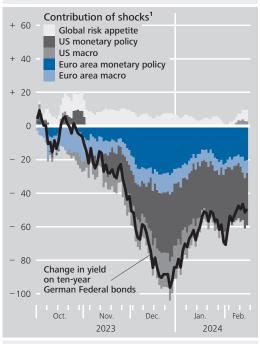

Decline in yields on ten-year Bunds In line with the yield on euro area bonds, yields on ten-year Bunds fell to 2.4%. The yield curve derived from yields on Federal securities shifted downwards almost uniformly during the period under review. The continued inversion of the yield curve, which is regarded as an empirical signal of market expectations that a recession will occur over the next 12 months, is therefore consistent with the gloomy economic outlook.¹ An estimated yield curve for real yields on Federal securities shows that real yields likewise fell during the period under review, especially in the long-term maturity segment. This indicates an expansionary impulse and, taken in isolation, more favourable financing conditions.

Global disinflation weighs on yields in other countries

Yields also fell in the United Kingdom and in other countries such as Canada and the Scandinavian countries, owing to market participants expecting a largely global disinflation process. In the United Kingdom, the yields on ten-year gilts fell by 48 basis points to 4.1% in the period under review. Yields on ten-year Canadian and Swedish sovereign bonds declined to a similar extent, while the decrease in Norwegian sovereign bond yields was somewhat smaller. In Japan, the Bank of Japan signalled that it believed the likelihood of achieving the inflation target of 2% sustainably was gradually increasing. At the same time, it maintained its very loose, and most recently somewhat more flexible, monetary policy of yield curve control, with the aim of keeping long-term yields close to 0%.2 In this environment, yields on ten-year

Deutsche Bundesbank

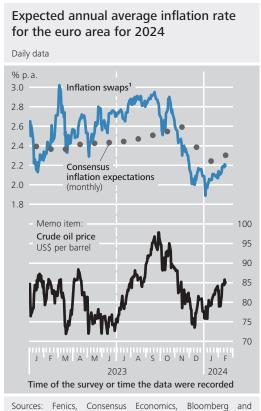

Japanese sovereign bonds remained virtually unchanged.

Yield spreads on euro area sovereign bonds narrowed further in view of market participants' increased hopes that there would be a rapid fall in key interest rates. Amid lower real interest rates and a significant increase in risk appetite, spreads on bonds issued by highly indebted governments, in particular, fell visibly. The ECB Governing Council's announcement that it would gradually reduce reinvestments under the pandemic emergency purchase programme (PEPP) over the second half of 2024 had no impact on the downward momentum of yield spreads. This was due, in part, to the fact that the pace proposed by the Eurosystem

Euro area yield spreads narrower

¹ See Deutsche Bundesbank (2023).

² The Bank of Japan recently loosened its yield curve control policy somewhat: at the end of July 2023, it raised the ceiling on ten-year sovereign bond yields by 50 basis points to 1%. At the end of October 2023, it decided that it would no longer apply this value as a rigid cap, but rather as a reference rate and thus more flexibly.

Bundesbank calculations. 1 Average of the monthly inflation fixing swaps due in 2024 indexed to the HCIP excluding to-bacco for the euro area.

Deutsche Bundesbank

for the reduction in PEPP bond holdings fell short of market participants' expectations. On balance, the yield spreads of ten-year Greek and Italian sovereign bonds over Bunds with the same maturity decreased by 38 and 42 basis points, respectively, from the end of September 2023. Overall, the yield spreads of ten-year sovereign bonds issued in the euro area over Bunds narrowed by 15 basis points (GDP-weighted average).

Market participants expect inflation to fall rapidly to 2% by the end of 2024 Short-term inflation expectations based on inflation swaps fell significantly in the period under review. Market participants now expect annual inflation rates of 2.2% and 2.0% for 2024 and 2025, respectively, thus close to the Eurosystem's stability mark. At the end of September, they were still forecasting rates of 2.7% for 2024 and 2.3% for 2025. This was mainly due to energy prices falling on balance, which had a dampening effect overall on the market-based inflation path for 2024. Statistical office publications also revealed surprisingly

lower current inflation rates than expected, contributing in part to market participants adjusting their inflation outlook downwards. The markets are currently pricing in a somewhat faster return to the price stability objective than experts indicate in their survey responses. Expectations of comparatively sharper key interest rate cuts, which are based on market data (see p. 29), are thus in line with the expectations of a stronger decline in inflation.

Market-based inflation compensation for the euro area for a horizon of between five and ten years likewise fell (by around 0.3 percentage point to 2.3%) in the period under review, while survey-based inflation expectations for this period remained unchanged at 2.0%. Taken together, this suggests that although market participants have become more confident regarding the future development of inflation, they continue to believe there are greater upside than downside risks to inflation developments in the euro area over medium to longer-term horizons.

Market participants continue to hedge against longterm upside risks to inflation

In the United States, the short-term market-based inflation outlook has also improved due to the downward trend in energy prices. Longer-term inflation indicators have fallen, too. However, actual inflation and the market-based inflation outlook on the other side of the Atlantic are still well above the Fed's target of 2%. Relatively robust US economic data, which represent an upside risk to the inflation process in the United States, are likely to have contributed to this.

Inflation expectations in the United States down, but still elevated

Yields on BBB-rated European corporate bonds and high-yield bonds with residual maturities of between seven and ten years fell significantly in line with the decline in risk-free interest rates. Within this rating category, bond yields of financial corporations fell more sharply than those of non-financial corporations. Given the noticeably higher risk appetite, yield spreads over Bunds with the same maturity also narrowed in both the BBB segment and, above all, in the high-yield segment. Thus, measured by

Corporate bond yields down significantly yield spreads, financing costs for European enterprises in all rating categories are currently close to or below their respective five-year averages. This is noteworthy given that these average values have been shaped not only by the coronavirus pandemic and the war in Ukraine, but also by quantitative easing and the effective lower bound regime.

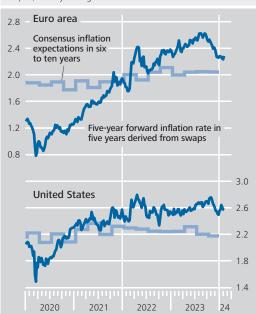

Equity market

International equity markets with noticeable price gains The international equity markets were characterised by the decline in risk-free interest rates and investors' increased appetite for risk, which boosted prices considerably. In the United States, prices were also supported by many investors' expectations of a "soft landing" for the US economy. Market participants interpreted signs of a stable economy, such as robust labour market data, as a factor weighing on equity prices in some cases, due to concerns that favourable economic signals could prevent the Fed from cutting interest rates quickly. Ultimately, however, these concerns proved to be short-lived, especially since the robust macrodata were also reflected in higher earnings expectations that supported equity prices. Even intermittent concerns about an escalation of the geopolitical situation in the Middle East ultimately had no visibly dampening effect on equity prices. Shares in technology companies, which have a high weighting on the US equity market, recorded above-average price gains. As a general rule, investors in these companies expect favourable long-term prospects, meaning that they benefit in particular from lower riskfree interest rates. Moreover, some technology companies were boosted by investors' hopes of advances in the use of artificial intelligence (AI). Among these companies were manufacturers of computer chips with the high computing capacities required for AI programmes.

The decline in risk-free interest rates and the robust appetite for risk likewise fuelled significant equity price gains in the euro area. However, these gains were lower than those re-

Forward inflation rates* and expectations in the euro area and the United States

Deutsche Bundesbank

corded in the United States. One important reason for this was the comparatively unfavourable economic outlook, which was reflected in downward revisions of earnings expectations, dampening the upward trend in equity prices. On balance, the prices of European equities (EURO STOXX) and German equities (CDAX) have risen by 10.8% and 9.1%, respectively, since the end of the third quarter of 2023. Equity prices in the United Kingdom (FTSE 100) remained virtually unchanged (-0.1%), as some commodity stocks included in the index weighed on price developments. By contrast, US equities (S&P500) and Japanese equities (Nikkei index) posted gains of 17.3% and 19.8%, respectively.

Some European and US bank stocks recorded strong price gains in the period under review. The prices of US bank stocks were clearly buoyed by growing confidence that the US economy could be heading for a "soft landing" rather than a recession. On balance, the prices

Banks on both sides of the Atlantic record gains

Equity price gains in Europe lower than in the United States

of European and US bank stocks rose by 6.2% and 25.0%, respectively, as compared with the end of September 2023.

US equity valuations have remained nearly constant since the end of the third quarter of 2023, while valuations for European equities have risen slightly, as indicated by the decrease in earnings yields and the implied cost of equity of European equities. The implied cost of equity is derived from a dividend discount model that also takes into account enterprises' mediumterm earnings outlook and the path of risk-free interest rates. In view of the diverging economic outlook on either side of the Atlantic, the regions' medium-term earnings prospects developed differently. Analysts revised their forecast for European enterprises somewhat downwards, which had a dampening effect on share price developments. Meanwhile, they raised their forecast for US enterprises. In a long-term comparison, the implied cost of equity and, in particular, the equity risk premia indicate a relatively high valuation for European and US equities overall.

Slight rise in equity market valuations

The German economy

Macroeconomic situation

German GDP shrank in Q4 2023

German economic output shrank in the fourth quarter of 2023. According to the Federal Statistical Office's flash estimate, real gross domestic product (GDP) fell by a seasonally adjusted 0.3% on the quarter after virtually stagnating in the first three quarters.1 Industry continued to be impacted by weak foreign demand. Higher funding costs remained a drag on investment and thus on domestic demand for industrial goods and construction work. Moreover, uncertainty about climate and transformation policy is likely to have dampened investment. In addition, inclement weather constrained construction activity. Further pressure was placed on economic activity by the relatively high sickness rate. By contrast, lower inflation, the robust labour market and strong wage growth supported real private consumption. However, consumers probably remained cautious in their expenditure.

■ Economic activity in detail

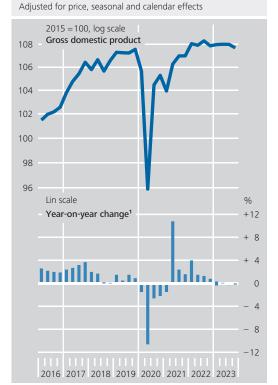

Weak demand for industrial goods reflected in production and exports Seasonally adjusted industrial output declined significantly in the fourth quarter of 2023. The decline affected most sectors, except for the manufacture of motor vehicles and other transport equipment. Order intake has been weak for some time now, and is likely to be a notable factor increasingly impacting on output. Surveys by the ifo Institute show that the share of manufacturing firms reporting a shortage of orders has risen steadily since April 2023, reaching 37% at the end of the period under review. By contrast, supply bottlenecks continued to ease according to ifo surveys. Weak foreign demand was also reflected in real ex-

ports of goods, which declined further in the fourth quarter.

Higher financing costs remained a drag on investment. Business investment in machinery and equipment is likely to have fallen significantly in the fourth quarter, as signalled by the steep decline in the price-adjusted sales of capital goods producers in Germany. Real imports of capital goods also saw a sharp drop. Enterprises invested less in their vehicle fleets. According to data from the German Association of the Automotive Industry (VDA), commercial passenger car registrations were down considerably. One factor that is likely to have played a role in this was the end of the environmental bonus for commercial owners at the end of August 2023.

Higher financing costs and end of environmental bonus dampened business investment in machinery and equipment

Aggregate output

Source of unadjusted figures: Federal Statistical Office. **1** Main construction sector and finishing trades.

Deutsche Bundesbank

Higher interest rates and inclement weather weighed on construction output and construction investment Construction investment probably declined significantly in the fourth quarter. Seasonally adjusted construction output was substantially lower on the quarter, both in the main construction sector and in the finishing trades. Higher interest rates continued to weigh on demand for construction work. Averaged over October and November, order intake in the main construction sector saw a substantial drop compared with the previous quarter, leaving it 17% down on its level in the fourth quarter of 2021. According to ifo Institute surveys, the share of firms in the main construction sector reporting a shortage of orders continued to rise significantly in the last three months of the year. In addition, the high levels of precipitation are likely to have adversely affected construction activity.2 Surveys conducted by the ifo Institute show that one-quarter of firms in the main construction sector reported that construction activity was hampered by weather conditions in the final quarter.

Private consumption is likely to have registered a slight increase in the fourth quarter. However, despite lower inflation, the robust labour market and substantial wage growth, households remained cautious with their consumer spending. According to the market research institution GfK, consumers were unsettled by the geopolitical crises and conflicts, sharp rises in food prices and the debate about the government budget.3 Price-adjusted sales in the retail sector once again declined somewhat. They were also down in the accommodation and food services sector, according to data available up to November. By contrast, households probably purchased considerably more cars, as indicated by private car registrations, which picked up substantially according to data provided by the German Association of the Automotive Industry. Meanwhile, activity in the services sector may have declined in the fourth quarter. According to data available up to November, services production (excluding trade) decreased. Trade in motor vehicles was probably also down. This is signalled by overall motor vehicle registrations, which declined markedly. The steep drop in commercial registrations outweighed the increase in private registrations. Real wholesale sales also decreased, probably partly in reflection of the weak industrial activity.

Labour market

The protracted bout of weakness in the economy has had only a mild impact on the labour market so far. Despite a decline in economic output, employment increased slightly in the fourth quarter. While unemployment reached a somewhat higher level than in the third quarter, the increase likely came to an end in the past two months. The number of job vacancies also stabilised recently, following an earlier decline. The same applies to most leading indica-

vices sector weak

Private con-

sumption and

activity in ser-

ment both up slightly in Q4

Employment and unemploy-

² The fourth quarter of 2023 saw exceptional levels of rainfall. See Deutscher Wetterdienst (2024).

³ See GfK (2023).

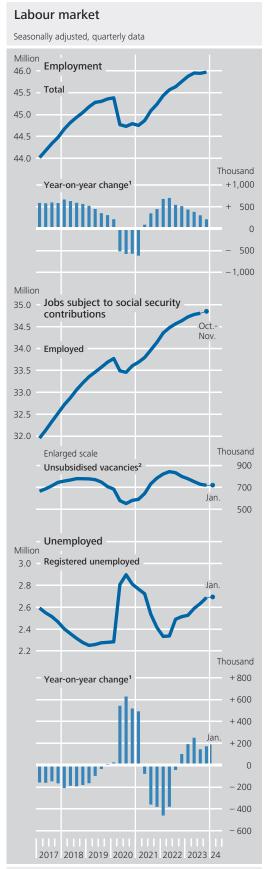

tors of the labour market. Thus, there are no signs that the weak economy will imminently cause the labour market to worsen noticeably. Nor are there any signs of a significant rise in employment and a concomitant decline in unemployment from its slightly elevated level.

Employment growth in some services sectors offset decline in manufacturing and trade

After the third guarter saw total employment stagnate, seasonally adjusted employment increased marginally in the final quarter of 2023, by 28,000 persons or +0.1%. There were declines in self-employment and exclusively lowpaid part-time employment, contrasting with an increase in the number of jobs subject to social security contributions. According to the Federal Employment Agency's initial estimates, which cover the period up to November, staff levels are still going up in areas of basic public services human health and social work, the public sector, energy and water supply, and education and training. Fairly positive developments were also seen in employment among qualified business service providers and in transportation and storage. Negative cyclical factors pushed down the number of temporary agency workers and of retail and wholesale staff slightly. The manufacturing and construction sectors saw a minimal dip in employment. Short-time work for economic reasons remained at its slightly elevated level. However, registrations for short-time work give no indication of a distinct increase over the next few months.

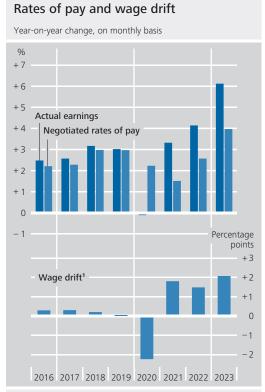

Further slight uptick in unemployment

Registered unemployment saw a slight uptick in the fourth quarter of 2023 as well. Looking at the quarterly average, the Federal Employment Agency recorded around 55,000 more persons as unemployed compared with the previous quarter, giving a seasonally adjusted total of 2.69 million persons. The unemployment rate climbed by 0.1 percentage point from the third quarter, to 5.8%. In January, unemployment remained virtually unchanged, as was the case in December. This was primarily due to an improvement on previous months in the number of unemployed people covered by the statutory unemployment insurance scheme, which is affected by cyclical developments.

Sources of unadjusted figures: Federal Statistical Office and Federal Employment Agency. **1** Not seasonally adjusted. **2** Excluding seasonal jobs.

Deutsche Bundesbank

Sources: Federal Statistical Office (actual earnings) and Deutsche Bundesbank (negotiated rates of pay). 1 Wage drift is calculated as the annual change in the ratio of actual earnings to negotiated rates of pay.

Deutsche Bundesbank

However, it would be premature to read this as good news for the economy, as weather conditions may also have played a role in December and January especially.

The majority of leading indicators improved slightly in December and January. This suggests they have bottomed out after the labour market outlook had deteriorated somewhat in the course of 2023. However, this does not yet indicate that a wave of recruitment is imminent. The seasonally adjusted number of reported vacancies rose somewhat in December and January, marking the end of a slight decline spanning roughly 18 months in what remains a fairly high number of vacancies. In particular, the Federal Employment Agency has recently received more new job ads. It still takes a very long time for a vacancy to be filled. The employment barometer of the Institute for Employment Research (IAB) for the economy as a whole remains in positive territory and improved a little. For this barometer, the IAB surveys regional heads of the employment agencies about the local outlook over the next three months. This also includes employment developments in the services sectors benefiting from structural change, such as health and education. However, the indicator of recruitment plans in trade and industry — which are more exposed to cyclical fluctuations — for the next three months, as derived from the ifo Institute's monthly survey of around 9,000 enterprises, shows a negative balance and deteriorated further in January.

The dynamics of future unemployment, as reflected in the transitions between unemployment and employment, improved in January for the first time in 18 months. In particular, unemployed people covered by the statutory unemployment insurance scheme stood a better chance of finding a job. At the same time, the transition rate from employment to unemployment remained close to its lowest level of the past 30 years, which was reached in 2022. The probability of dismissal is thus still very low. The IAB survey on unemployment is no longer quite as deep in negative territory. The number of unemployed persons is therefore likely to stabilise in the coming months.

Number of unemployed unlikely to see any further significant rise

Wages and prices

In the fourth quarter of 2023, negotiated wages temporarily rose less sharply than in the third quarter. Including additional benefits, they were up by 3.6% on the year in the fourth quarter, compared with 4.7% in the quarter before. As in the first three quarters of 2023, large tax and social contribution-exempt inflation compensation bonuses played a key role. Factoring out these one-off payments, negotiated wages rose by 2.5% year on year in the fourth quarter, a distinctly slower increase than the 2.9% recorded in the third guarter.⁴ How-

Weaker rise in negotiated wages in Q4, ...

Most leading indicators of employment showing first tentative signs of improvement

⁴ The higher increase in the third quarter was mainly due to the high inflation compensation bonus of €1,240 for Federal civil servants, which was paid out in September 2023

House prices in Germany in 2023

House prices fell significantly in 2023, primarily because credit-financed real estate was less affordable as a result of high inflation and the interest rate hikes from the second half of 2022 onwards. Monetary policy tightening also reduced demand for housing. This meant demand increasingly shifted to the rental market, and the already high inflation in rents saw a significant further acceleration. The faltering expansion of supply helped prevent prices from falling even further. Overvaluations came down as prices fell in 2023. As a result, there is currently less downside potential than in previous years. However, as overvaluations are not yet fully eliminated, further corrections cannot be ruled out.1

According to data from the Association of German Pfandbrief Banks (vdp), the prices of owner-occupied housing fell by 4.1%. Averaged over the first three quarters of 2023, the Federal Statistical Office's price index fell much more sharply compared with the same period of the previous year, namely by 8.9%. Hypoport AG's EPX price index for residential real estate declined by 4.2% in 2023. All three indicators show a considerable decline in house prices.

According to calculations based on price data provided by bulwiengesa AG, house prices in the 127 German towns and cities fell by 4.5% last year, after having risen significantly by 6% in the previous year. In the seven major cities, the decline came to 5%.² The quarterly vdp data paint a similar picture, with house prices in the seven major cities falling by 5.3% in 2023 according to this measure. Comparing the vdp data for major cities with those for Germany as a whole confirms the impression gleaned from the previous upswing in prices

– that the prices of residential real estate tend to move more quickly in metropolitan than in rural areas. Since the turning point in 2022, prices in towns and cities have come down more than in less populated districts. However, price measurement is currently subject to particularly high uncertainty. In particular, the importance of properties' energy efficiency in determining prices may have increased. The price changes reported may also reflect higher markdowns for properties with low energy efficiency.³

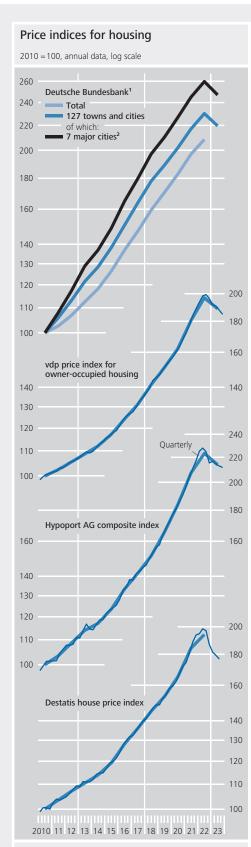

Unlike purchase prices, rents rose last year, with growth significantly stronger than in 2022. According to vdp, the year-on-year rise in rents for new lettings in multi-family dwellings was 6.3%. This equates to a further acceleration in rental inflation as compared with previous years. According to calculations based on data provided by bulwiengesa AG, rents for new lettings rose by 5.5% in towns and cities. Rents in the seven major cities went up by almost 7%.

During 2023, much tighter financing conditions and the only gradual decline in inflation from a very high level weighed on the propensity to acquire residential real estate. However, after adjustment for inflation, households' disposable incomes recovered over the course of the year. Population growth, which was buoyed by immigration,

¹ This box deals with the ramifications of house price developments for the real economy. To assess them from a financial stability perspective, it is also necessary to consider aspects relating to housing loans.

² The seven major cities are Berlin, Cologne, Düsseldorf, Frankfurt am Main, Hamburg, Munich and Stuttgart.

³ See Deutsche Bundesbank (2023a). This is the case, amongst other things, if the influence of properties' energy efficiency feeds into the index in a time-invariant manner.

1 Weighted by transaction. Bundesbank calculations based on price data provided by bulwiengesa AG. 2 Berlin, Cologne, Düsseldorf, Frankfurt am Main, Hamburg, Munich and Stuttgart.

Deutsche Bundesbank

also helped prevent a stronger dampening of demand. Moreover, interest rates on loans for house purchase, although significantly higher, were no higher in the reporting year than in 2009 after adjustment for long-term inflation expectations. The dampening of demand caused by monetary policy did contribute quite strongly to the decline in house prices. However – given that demand came down from a very high level - the reduced affordability of loanfinanced residential property was a more decisive factor in bringing down prices. This is also likely to be one reason for the large increase in rental prices for new lets. Many potential buyers were probably forced to rent rather than buy, at least for the time being.

Supply grew even more slowly in 2023. The cost of construction materials rose sharply following very high growth in 2022, in part due to ongoing supply bottlenecks and shortages of building materials. In addition, wage costs in the construction sector increased. Moreover, tighter financing conditions hampered growth in supply. The number of completed housing units, which had stood at 295,000 in previous years, is likely to have declined in 2023 due to the exceptionally large number of cancellations. The number of building permits is also likely to have decreased sharply in 2023, to around 270,000.

Overvaluations in towns and cities declined significantly in 2023.⁵ Estimations show that residential property prices in towns and cities were between 15% and 20% above the level that socio-demographic and economic fundamentals would suggest is ap-

⁴ See ifo Institute (2023)

⁵ This development had already started to emerge during the course of 2023. See Deutsche Bundesbank (2023a).

propriate.⁶ The decline was especially marked in the seven major cities. The pricerent ratio for housing units in towns and cities exceeded its longer-term average by around 20%. The aggregate price-income ratio was just over 20% above the reference value in 2023. The long-term relationship between real estate prices, interest rates and incomes indicates overvaluations ranging from 10% to 15%.7 Overall, overvaluations, though considerably reduced, are unlikely to have been brought down to zero. This means that there is still a certain risk of price corrections.

> 6 For details on the underlying panel estimation approach, see Deutsche Bundesbank (2020a). 7 For more details on the valuation approaches, see Deutsche Bundesbank (2020b).

ever, this cannot be taken to imply a turnaround towards lower negotiated wage increases in the future, because the wage agreements recently negotiated include zero months with no wage rises at the beginning of their terms. Subsequently, inflation compensation bonuses will be paid out with a time lag. 5 There will then be significant, permanent wage increases from the fourth quarter of 2024. All in all, the pay round settlements for 2024 and 2025 envisage robust negotiated wage increases.

The sharp growth in actual earnings in the previous ten quarters continued and is likely to have once again significantly outstripped the increase in negotiated wages in the fourth quarter of 2023. This is also indicated by the sharply higher nominal wage data available through to December 2023 from the Federal Statistical Office's earnings survey. According to interim figures calculated on the basis of data

from the national accounts, growth in actual

earnings amounted to 6.1% in 2023, the highest rate since 1992.

The latest collective pay agreements delivered Latest collective particularly strong wage increases. In annualised terms, wages rose by 5.9% in the public sector of the Federal states, 4.8% in the steel industry and 4.0% in the wood and plastics processing industry.6 In the retail sector, as well as in wholesale and foreign trade, no new agreement has been reached in the negotiations that have been dragging on since April 2023. This dampened the rise in the 2023 ne-

wage agreements deliver strong increases; still no deal struck for trade

... but continued strong growth in actual earnings

5 In the case of the negotiated pay rises to be registered in the first few months of 2024, it matters when the inflation compensation bonuses are recorded in the statistics. For example, the inflation compensation bonus of €1,800 agreed in mid-December 2023 in the public sector of the Federal states will not be paid out to wage earners until the first quarter of 2024 owing to official regulations.

6 For someone earning the agreed basic pay rate. Owing to base amounts and inflation compensation bonuses, the increase can be higher in lower pay grades and lower in higher ones. In the wood and plastics processing industry, the rise varies slightly depending on the region.

gotiated wage index for the macroeconomy owing to the large number of zero months. Future sector agreements could significantly raise wage growth rates in 2024.

Major pay round for just under 60% of salaried staff The first few months of this year's pay round for roughly 13 million wage earners (just under 60% of salaried staff) will mainly see negotiations in some services sectors and in the main construction sector. Attention switches to major industrial sectors such as the chemical industry as of May, followed by the metal industry from summer onwards. Trade unions are still demanding very high wage hikes, with past real wage losses likely to be a factor in their demands: an increase of 12% over a 12-month term in the printing sector, a rise of 8.5% over a 12-month term in temporary agency employment, and a permanent monthly wage increase of €500 (around +13%) in the main construction sector. IG BCE, the trade union for mining, chemicals and energy, is recommending wage demands of +6% to +7% for negotiations in the chemical industry. It should be noted, however, that the latest collective wage agreement reached in the chemical industry has already exhausted the legal scope for inflation compensation bonuses exempt from tax and social security contributions (limited to €3,000).7

High wage pressures expected in 2024 as well

Trade union demands for lasting improvements to real wages combined with widespread labour shortages suggest that prospective new pay deals will be high. By contrast, weak economic activity and the likely further easing of inflation could put something of a damper on the new pay increases being negotiated. Trade unions' willingness to strike is likely to remain high given the real wage losses that have arisen over the past three years and have not yet been fully compensated for. Unions have achieved a higher percentage of their demands since 2022 than in the previous 15 years. In the pay round settlements for 2023, and those on record for 2024, increases in real wages often only came about thanks to the high inflation compensation bonuses. As calls are still being made for improvements to real wages, higher permanent negotiated pay increases might be agreed after the end of the year, which is when these special bonuses will expire. According to the aggregate profit margin indicator, profit margins in the third quarter of 2023 – quarterly data are available up to this point - rose only marginally on the year in seasonally adjusted terms.8 Profit margins widened in the manufacturing sector and narrowed in the services sectors. Aggregate profit margins increased by 3% compared with the first guarter of 2021. There were significant differences between the sectors. Profit margins rose by just under 3% in manufacturing (excluding construction) and by around 30% in construction, but they were up by only 1% in the services sectors. The latter sectors are therefore likely to have built up less scope than in manufacturing to cushion the intense wage cost pressures observed recently in some cases.

Effective from January 2024, the general statutory minimum wage rose from €12 to €12.41 per hour, a hike of 3.4%. This increase is having no significant impact on average wages in the economy as a whole, as it mainly affects lower wage brackets in low-paid jobs with very few spill-over effects on higher pay grades.

Minimum wage increase to €12.41 with small aggregate wage effects

For the first time since the end of 2020, consumer price inflation (HICP) was only marginal in the fourth quarter of 2023. On average across the months of October to December 2023, consumer prices increased by only a seasonally adjusted 0.2%, compared with a rise of 0.7% in the previous quarter. This was mainly

Disinflation process continued in O4 2023

8 The profit margin indicator corresponds to the ratio of the gross value added deflator to unit labour costs.

⁷ The pay deal concluded in the chemical industry in mid-October 2022 was the first in a major sector to feature an inflation compensation bonus exempt from tax and social security contributions. As this deal exhausted the legal scope for inflation compensation bonuses, the next pay deal will no longer contain that component. Along with a reference to securing real wages in the long term, the high wage demands are backed up by an internal survey conducted by the IG BCE trade union, which finds that three out of four salaried employees in the chemical industry are having to make cuts to their household budgets. Furthermore, 55% of them said that their personal economic situation is currently worse than it was one year ago.

Recent inflation developments in the light of a stylised macro model

In the fourth quarter of 2022, the inflation rate in Germany and the euro area reached all-time highs in excess of 10%. Although inflation rates have gone back down considerably since then, they are still just shy of 3%. In the academic and economic policy debate, a wide variety of possible explanations have been ventured as to what caused inflation to rise following the subsiding of the COVID-19 pandemic. Reference is made, amongst other things, to supply bottlenecks and commodity price shocks, but also to domestic factors such as excessively accommodative monetary and fiscal policy in response to the COVID-19 pandemic.1,2

A broadly acclaimed contribution to the debate on the triggers and determinants of the high inflation was made by Bernanke and Blanchard (2023), initially for the United States. For their research, they used a small stylised macroeconomic model of a closed economy, consisting of a price equation, a wage equation and an equation each for short-run and long-run inflation expectations. At the core of the model are the interactions of inflation, wages and expectations. The impacts of exogenous shocks can thereby be amplified. The authors find, in their estimates for the United States, that commodity price shocks and supply bottlenecks triggered the rise in the inflation rate. Tight labour markets, through higher wage agreements, only contributed later, though with greater persistence, to price increases.3

The Bernanke-Blanchard model was applied to various euro area countries, Japan, the United Kingdom and Canada as part of an international working group. In this context, the Bundesbank applied the model to

Germany and the euro area (see Menz (2024)).4 As in the United States, the rise in inflation rates in the euro area is likewise attributable to energy and food price shocks and supply bottlenecks. The triggers for these shocks are not explained in the model itself. However, it stands to reason that supply and demand factors made a contribution. Granted, the high labour market utilisation, which was due in part to supply and demand factors, led to high wage rises in the euro area, too. However, the pricedriving effects this unleashed, according to the model, have thus far been somewhat weaker than in the United States. Owing to the interaction between prices, wages and inflation expectations baked into the model, the estimated impact of wages on prices contains second-round effects. Moreover, the model does not provide any evidence that the surprisingly high inflation rates in the past were reflected in additional wage demands to such an extent as to have led to an explosive wage-price spiral. To be sure, short-run inflation expectations responded to energy price shocks and current price surges, which also amplified wage

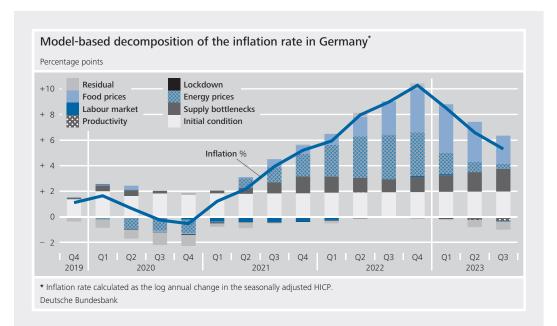

¹ Greater attention was also given to claims of "greed-flation", according to which firms took advantage of their market power and the particular circumstances of the post-pandemic era to raise their prices more strongly than would have been necessitated by cost pressures. However, there has so far been virtually no empirical evidence in support of this allegation.

² For details and references to academic and economic policy studies, see Menz (2024).

³ For a comparison of inflation developments in the United States and the euro area, see also Deutsche Bundesbank (2022).

⁴ The model is estimated econometrically as a structural VAR, which is extended to a panel approach for the euro area, incorporating country-specific effects.

⁵ The transmission of wage growth to prices has not changed significantly in connection with the high inflation rates of recent years. In Germany, it still stands at just over one-third. See e.g. Deutsche Bundesbank (2019c) and Bobeica et al. (2019).

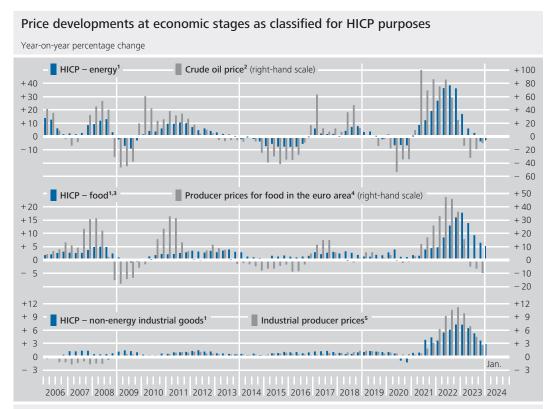

growth. However, short-run inflation expectations remained highly correlated with long-run inflation expectations. This anchoring of inflation expectations has had a stabilising effect overall.

The model can be used not only to analyse the recent past but also to derive possible scenarios for movements in prices, wages and inflation expectations in the near future. Assuming that labour markets gradually ease and no new shocks occur in the commodity markets, the model assumes that inflation will gradually decline in the near future. The results for Germany are broadly in line with the Bundesbank's inflation forecast from December of last year, according to which the inflation rate in Germany will not return to levels of just over 2% until sometime during 2026 (see Deutsche Bundesbank (2023b)). By contrast, in the current model scenarios for the euro area, inflation returns more rapidly towards the 2% mark than forecast by the Eurosystem in December (see European Central Bank (2023)).

By focusing on the interactions of prices, wages and expectations, the Bernanke-Blanchard model, on the one hand, makes

an important contribution to the analyses of these key macroeconomic variables. On the other hand, it disregards a number of price-driving factors such as monetary policy, taxes and other fiscal measures, but also specific information on individual markets (such as weather effects or sector-specific price-setting behaviour). However, these can be of crucial importance for a good forecast. In this sense, the scenarios of falling inflation rates should be understood as evidence in support of the downwardsloping but more detailed forecast paths in the Eurosystem's projections. A precondition for the disinflation process to be expected according to the Bernanke-Blanchard model actually occurring in the euro area is that the commodity markets are not hit by any new price shocks and that the labour market tightness is overcome. Given the persistence of geopolitical uncertainties, further commodity price shocks, in particular, cannot be ruled out. The Bernanke and Blanchard model also suggests that, should such price-driving influences continue for longer, a timely return in the direction of the 2% mark will become more difficult.

Deutsche Bundesbank

due to the sharp fall in energy prices. Moreover, prices for industrial goods excluding energy and services did not go up quite as strongly as in previous quarters. Food prices, meanwhile, rose at more or less the same rate as in the third quarter. The process of disinflation in the fourth quarter was evident in year-on-year terms as well, with the headline inflation rate falling significantly to 3.0% from a level of 5.7% in the same quarter of the previous year. The sharp rise in energy prices in the final quarter of 2022 had a dampening effect here, but the core inflation rate (HICP excluding energy and food) also dropped steeply, falling from 5.8% to 3.6%.

The HICP rate dropped markedly in January as well, from 3.8% to 3.1%.9 This was mainly due to the elimination of the base effect from the 2022 price-lowering Emergency Aid for Natural Gas Heating for End Consumers (*Erdgas-Wärme-Soforthilfe*), which had temporarily significantly increased the December rate. Food

and non-energy industrial goods inflation likewise eased considerably. By contrast, services saw strong price increases at the beginning of the year, especially in areas where prices are not administered. Rents went up at a faster pace and numerous insurance premiums became more expensive. In addition, prices in restaurants and cafés recorded an extraordinary surge. One factor at play here was the expiry of the temporary VAT cut for meals eaten in catering establishments, even though the tax increase was probably not passed through fully into consumer prices. Lastly, the national carbon price charged on fossil fuels went up. On balance, the core rate remained at 3.4% in January.

Inflation fell somewhat further in January; core rate unchanged

⁹ The national CPI rate stood at 2.9%, down from 3.7%. In the case of the HICP, the January figures are also based on the routinely updated weights for 2024. Here, there were no major changes in consumer spending – compared with previous adjustments made over the pandemic period.

Demand for industrial goods and construction services

Deutsche Bundesbank

Disinflation process expected to slow down

The inflation rate will probably generally decline further in the next few months. In some cases, strong fluctuations in the year-on-year rate are to be expected. This is due to some base effects in energy and local public transport. Moreover, Easter falls earlier this year than last, which is relevant for package holiday prices. The main factor behind the disinflation process is the declining price dynamics in food and industrial goods. Here, weakening inflation has an impact on upstream stages. By contrast, price pressures in the services sector are likely to ease much more slowly in the coming months, partly because wage growth remains strong.

Order books and outlook

Some headwinds will probably persist into the first guarter of 2024. Foreign industrial demand tended to decline significantly of late as well. Consumers are likely to remain cautious in their spending. Higher funding costs may continue to constrain investment. Additionally, uncertainty regarding climate and transformation policy remains elevated. Disruptions to production resulting from various strikes - including the rail and aviation strikes - cannot be ruled out, either. There are still orders on hand in industry and construction. However, they are dwindling. Economic output is thus likely to once again contract slightly in the first quarter of 2024. This second consecutive decline in economic output would put the German economy in a technical recession. While this would mean the ongoing period of weakness in the German economy following the start of the Russian war of aggression against Ukraine would continue, there is still no evidence of a recession in the sense of a persistent, broadbased and distinct drop in economic output and no such recession is expected, either. 10 In particular, the income situation and thus household consumption are likely to continue to improve in the future given the stable labour market, sharply rising wages and the declining inflation rate.

Industry is still navigating choppy waters at the beginning of the year. Demand for industrial products remained weak. December saw a sharp rise in industrial new orders on the month in seasonally adjusted terms, but this increase was attributable to large orders. Excluding this volatile component, new orders remained in significant decline. On an average for the fourth quarter of 2023, incoming orders levelled off close to the level of the previous quar-

ter. Excluding large orders, both domestic and

foreign demand for industrial products fell sub-

stantially. According to Federal Statistical Office

data available up to November, the order books

Economic output could contract again in Q1 2024

Industrial activity still weak at beginning of year were still relatively well-filled. However, they have already shrunk considerably compared with the previous year. Short-term export expectations, along with production plans that deteriorated in January according to surveys by the ifo Institute, also suggest that industrial activity will remain weak.

Private consumption probably still sluggish Consumers are likely to have significantly greater spending scope in the current quarter. Nevertheless, they are probably still holding back on their spending. The GfK consumer climate indicator deteriorated markedly again, with both the propensity to purchase and in-

come and economic expectations declining. At the same time, the propensity to save increased significantly. Despite substantial growth in real incomes, private consumption is therefore likely to remain relatively sluggish in the first quarter. January's sharp drop in private car registrations, according to data from the German Association of the Automotive Industry, is one of a number of factors supporting this view. Surveys by the ifo Institute show that business conditions in the consumer-related retail and accommodation and food services sectors likewise deteriorated.

Public finances*

General government budget

2023 as a whole

Government finances improved in 2023

Germany's government finances improved last year. The deficit and debt ratios continued to decline. While the deficit ratio remained at 2% of gross domestic product (GDP), it was mainly the result of temporary relief measures. In addition, weak economic activity put a slight strain on budgets. In structural terms, the government budget was thus roughly balanced (for more details, see pp. 59 ff.). The debt ratio amounted to just under 65% at the end of the third quarter. Compared with its crisis peak of 69% in 2021, this constituted a swift and significant drop towards the reference value of 60%. The drop was due to the fact that, mainly as a result of price factors, nominal GDP grew more strongly than debt (denominator effect). The deficit and debt ratios remained moderate by EU standards.

Deficit ratio fell only because coronavirus response measures lapsed The deficit ratio fell by 1/2 percentage point compared with 2022. However, this was not attributable to austerity policies, but instead to the lapsing of temporary coronavirus response measures amounting to almost 11/2% of GDP. By contrast, support measures relating to the energy crisis burdened public coffers slightly more than in 2022 (see the chart on p. 60). A contributing factor here was that policymakers opted for broader transfers with virtually no means testing. This is especially true of the energy price brakes, but also of the exemption from taxes and social contributions applicable to inflation compensation bonuses. Weaker economic activity increased the deficit slightly. In addition, tax revenue was significantly weaker than would have been expected on the basis of macroeconomic developments and legislative changes. The preceding remarkably sharp rise in tax revenue in 2021 and 2022 was partially offset by the countermovement in 2023 (see p. 62). On the expenditure side, some items increased significantly; besides interest expenditure, these included military spending.

Outlook for 2024 and 2025

The deficit is likely to decline further this year, but as things stand not below 1½% of GDP. The expected decline is due to the discontinuation of energy crisis support measures by the Economic Stabilisation Fund for Energy Assistance (ESF-E). Following the ruling of the Federal Constitutional Court in November 2023, central government decided not to extend them into 2024.¹ It is therefore withdrawing this assistance somewhat more quickly than previously planned. Outside of temporary influences of this nature, the fiscal balance is likely to deteriorate further. Consequently, a moderate structural deficit is to be expected.

Deficit will also decline in 2024, but deterioration is likely in structural terms

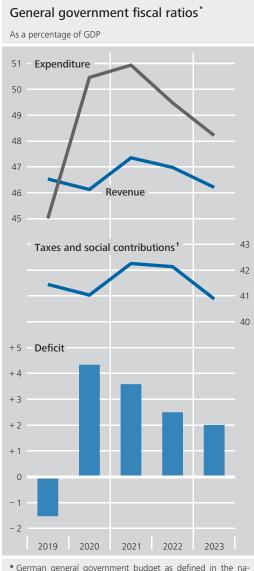

Compared with 2023, the structural deficit is likely to rise, mainly as a result of additional expenditure in the Climate Fund and the Armed Forces Fund. The smaller consolidation measures in other areas of central government finances are much too small to offset this in full. Furthermore, the deficits of state and local governments could expand somewhat. The recent higher price increases are likely to continue to push up spending, with the latest wage agreements and adjustments to civil servant pay significantly raising personnel expenditure.

The financial situation of the social security funds is also expected to deteriorate somewhat

Larger deficits, especially in Climate Fund and Armed Forces Fund

^{*} The section entitled "General government budget" relates to data from the national accounts and Maastricht debt. This is followed by reporting on budgetary developments (government finance statistics) in the areas for which data are available for 2023 as a whole.

¹ For more information on the ruling, see Deutsche Bundesbank (2023a); on central government's plans for 2024, see pp. 68 f.

* German general government budget as defined in the national accounts. 1 Taxes and social contributions plus customs duties and bank levies to the Single Resolution Fund. Deutsche Bundesbank

in 2024. Expenditure on pensions, healthcare and long-term care will grow more strongly in overall contribution rate to the social security

From the current perspective, the general government deficit ratio looks set to fall again next

funds is likely to rise to almost 41% this year

(2023: 40.5%).

year. Central government will then have largely used up its extensive budgetary reserves in the Climate Fund and core budget and will have to reduce deficits in those areas.2 In addition, the last temporary support measures will expire in 2025 (in particular the exemption from taxes and social contributions applicable to inflation compensation bonuses). Compared with this relief, factors placing a burden on the budget, such as an increasing deficit in the Armed Forces Fund, are likely to be of less significance.

Deficit is also likely to fall in 2025

The debt ratio is expected to decline further in 2024 and 2025. While nominal GDP growth is not expected to be as strong as in 2023 due to slowing price dynamics, it is anticipated that the deficit will be lower. However, the decline in the debt ratio will be smaller if central government takes out loans to build up a generational capital fund to ease the burden on the statutory pension insurance scheme.

Debt ratio on downward path

Reform of EU fiscal rules

The planned reform of the EU fiscal rules could bring about significant changes in the European rules applicable to Germany as of next year (for information on the reform, see p. 65).3 As things currently stand, it looks like Germany will have to limit its structural deficit ratio to a maximum of 11/2% under the reformed rules.4

2 The debt brake limits net borrowing. In 2024, central

government is financing parts of the deficit using reserves.

By doing so, it can run a correspondingly larger deficit and

nevertheless comply with the ceiling on net borrowing it

has calculated. If the reserves are used up in 2025, the def-

icit will have to fall accordingly in order to continue to

comply with the ceiling.

Reform of EU fiscal rules: requirements will change for Germany, too

structural terms than the reference variables for contributions. In addition, central government will cut several grants, such as to the statutory health and pension insurance schemes. Additional revenue from higher contribution rates for long-term care insurance and health insurance will only partially offset the burdens. The

3 In 2024, Germany is likely to comply with the EU rules, partly because support measures relating to the energy crisis are now expiring earlier than initially planned (this had been requested by the European Commission; see European Commission (2023)). The Independent Advisory Board of the Stability Council also assumes that Germany will comply with the EU requirements (see Independent Advisory Board of the Stability Council (2024)).

4 The structural deficit for the purposes of the EU rules is calculated using a method different to the Bundesbank's estimation approach. For example, the European Commission has reported a significantly larger structural deficit for Germany in recent years. This is mainly due to the fact that it hardly excludes any temporary crisis measures.

Slight deterioration in social security funds finances despite rising contribution rates

German government budget in times of crisis – developments in the period 2020 to 2023¹

The COVID-19 pandemic and the energy crisis had a massive impact on the German general government budget. In 2019 – prior to the outbreak of the pandemic – a surplus of 1½% of gross domestic product (GDP) was recorded. In the first year of the pandemic, which saw substantial restrictions on economic activity in some cases, the deficit ratio was just over 4%.² Since then, it has been gradually declining. Based on initial figures (from mid-January 2024), it stood at 2% in 2023.

This box takes a closer look at the developments in the government budget since 2019. For this purpose, general government revenue and expenditure in the national accounts are broken down into temporary and structural shares. Here, factors with a temporary influence include cyclical effects, crisis measures, and other one-off effects. The indirect effects of the pandemic, which are more difficult to capture, have not been factored out of the structural balances. For instance, expenditure on non-coronavirusrelated medical treatment decreased and revenue from fees was lost due to the use of government facilities being restricted at times. As the Bundesbank uses its own analytical methods and estimates, the data on structural balances differ from those of other institutions.³ Revisions to the national accounts data and a changed macroeconomic outlook will have an effect on the results presented below.

Cyclical deficits caused by economic downturn

In 2019, the influence of cyclical factors on the government budget was still clearly positive. However, it subsequently turned strongly negative in 2020 (see the table on p. 63, item 2). The economic downturn resulted primarily in a decline in tax receipts and increased expenditure on short-time work. It had a much more moderate impact on social security contributions and spending on unemployment benefits. The economy rebounded in 2021 and 2022. In 2023, however, the cyclical impact on the deficit was once again slightly negative.

Temporary measures were a considerable drag

Temporary crisis-related measures weighed more heavily on the government budget than cyclical factors (see the chart on p. 60). In the period from 2020 to 2022, these measures accounted for an annual volume of around 3% of GDP. In 2022, new relief measures in response to the energy crisis virtually cancelled out the reduced coronavirus measures. Last year, the remaining coronavirus-related spending for 2022 largely came to an end. The total volume of support measures fell to 1¾% in 2023.

The corporate sector received the largest share of the temporary support measures.

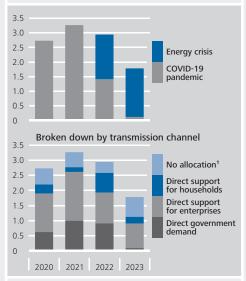

¹ See Deutsche Bundesbank (2006) for notes on the analytical approach used here. The analysis relates to data from the national accounts.

² The last time the general government budget recorded a greater deterioration was in 1995: this was due to the assumption of debt totalling €122 billion (6½% of GDP), which affected the deficit at the time − largely from the Treuhand agency, which was responsible for the privatisation and winding-up of stateowned enterprises and formed part of the corporate sector.

³ For example, the Federal Government and the European Commission generally do not factor out the support measures temporarily put in place during these years from the structural government budget, which is why the levels and changes they report differ considerably from the data presented here.

* Bundesbank estimate. This definition does not include longerterm fiscal projects. 1 VAT rate and energy tax rate cuts, revenue shortfalls due to employers' one-off payments being exempt from income tax and social contributions, stabilisation of the renewable energy (EEG) levy and reduction in fares for local public transport (€9 ticket).

Deutsche Bundesbank

These included direct transfers (primarily coronavirus bridging aid from 2020 to 2022), payments to offset losses (primarily for gas trading companies in 2022), the majority of the energy price brakes (2023), and the assumption of social contributions for short-time work from 2020 to 2022.4 In addition, special tax arrangements boosted corporate liquidity. In essence, these arrangements merely had the effect of shifting tax revenue along the time axis. Examples include the deferral of special advance VAT payments and an increased scope for loss carrybacks. 5 Households primarily received one-off energy price allowances (2022), transfers from the energy price brakes (2023), and bonus child benefit payments (2020 to 2022). VAT rates were temporarily lowered for enterprises and households (generally in the second half of 2020, on restaurant meals from July 2020 until the end of 2023, for gas and heating from autumn 2022, currently set to expire

at the end of March 2024), as were energy tax rates (summer 2022). In addition, in 2021, the government employed subsidies to stabilise the renewable energy (EEG) levy. Moreover, since the end of 2022 up to and including 2024, inflation compensation paid out to workers has been exempt from taxes and social contributions. An overview of the most significant measures can be found on p. 61.

Real government consumption also saw a significant temporary increase. For example, the COVID-19 pandemic resulted in a significant amount of healthcare-related government spending. Initially, this was on personal protective equipment, additional intensive care capacities and PCR tests, subsequently also on vaccinations, and finally on tests for the general public. Moreover, central government paid temporary compensation to hospitals so that they could keep empty beds available.

Finally, in addition to refunds for pandemicrelated payments, central government paid extensive special grants to the social security funds. Without these, the funds would have needed to raise their contribution rates to a much higher level in order to close funding gaps.

Temporary non-crisis-related influences

Temporary one-off non-crisis-related influences also had an impact; these are factored out of the structural balance. Specifically, this relates to two effects that increased the deficit in 2021 (each of which accounted for around 0.1% of GDP). First, the

⁴ Expenditure on short-time working benefits is largely regarded as a cyclical influence.

⁵ Added to this were other government support measures such as loan guarantees, loans and equity participations in response to the coronavirus pandemic. These were not reflected as financial transactions in the national accounts deficit, but in the debt level only.

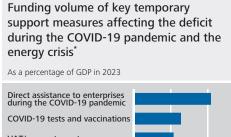

government paid one-off compensation to energy companies in the context of Germany's moving away from nuclear power. Second, it refunded interest paid on tax debts because the Federal Constitutional Court ruled that the interest rate was too high.⁶

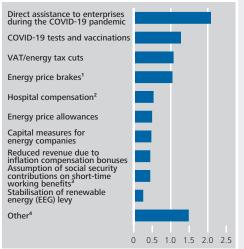

Moderate deterioration in the structural balance during the crises

The structural balance is obtained by deducting the cyclical effects, temporary measures and influences described above from the unadjusted balance.

Over the course of the crises, the structural situation of the government budget underwent a moderate deterioration (see the table on p. 63, item 4): having recorded a surplus of ½% of GDP in structural terms in 2019, it was roughly balanced in 2023. The expenditure ratio increased at a slightly steeper rate than the revenue ratio (the structural ratios are presented here and below).

The structural general government budget ratio fluctuated strongly over time. This is due in large part to the tax ratio. The models are not well suited to explaining its upward and downward movements (see item 8.4). In the case of non-tax revenue (primarily sales) and individual categories of expenditure (primarily subsidies), interim changes in ratios are due in part to the fact that it is not always possible to identify temporary influences conclusively. However, this is virtually irrelevant when it comes to comparing the development of the structural general government budget in 2023 with 2019. The erratic upward and downward fluctuations largely balance each other out over this period.

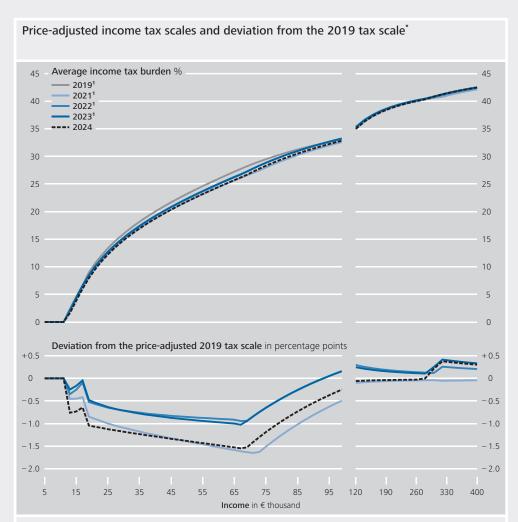

* Bundesbank estimate of reduced/increased government revenue from 2020 to 2023. I Including payments for December 2022 energy bill installments. 2 Compensation payments for keeping beds unoccupied. 3 Excluding expenditure on short-time work, as this is mostly counted as cyclical spending. 4 Additional expenditure on health protection measures, tax measures, social transfers and grants.

Deutsche Bundesbank

In terms of revenue, the social security contributions ratio increased because contribution rates were raised: the average supplementary contribution rates for health insurance institutions rose each year from 2020, while the contribution rates for unemployment and long-term care insurance went up in 2023. As a result, the overall social contribution rate was 40.5% last year, compared with 39.7% in 2019.

The tax ratio fluctuated significantly and was down slightly on 2019. Although bracket creep had a positive impact – especially in the past two years, due to high inflation (see item 8.1) – tax cuts were more than twice as substantial overall (see item 8.3). With regard to income tax (including the solidarity surcharge), legislators have

⁶ The national accounts record payments based on court rulings as government capital transfers as soon as the ruling enters into legal force and it becomes possible to gauge the level of reimbursement.

Sources: Federal Ministry of Finance and Bundesbank calculations. * Based on the income tax scale for individually assessed taxpayers. The tax scales are shown inclusive of the respective solidarity surcharge. They are adjusted using the deflator for private consumption from the national accounts (for 2024: Bundesbank projection). To this end, incomes are deflated using the inflation rate from the respective year in which the tax scale applied through to 2024. The respective applicable tax rates are then applied. If tax scales always shifted exactly in line with the inflation rate, the scales would overlap exactly. 1 Price-adjusted.

Deutsche Bundesbank

lowered the overall scale more than the tax burden has increased due to bracket creep (see the chart above). This is essentially due to the fact that the solidarity surcharge was completely or partially abolished for lower and medium income households in 2021. In 2022 and 2023, the price-adjusted tax scales were again noticeably higher for a time than in 2021. This is because legislators only brought the tax scale into line with inflation for the respective year in the subsequent year. This means that when inflation rates rise, the price-adjusted tax burden also goes up. This year, the scale will drop back down towards the level recorded

in 2021. One exception to this is the section of the scale above the threshold for the top-income tax bracket. Legislators have not brought this into line with inflation recently.⁷

7 In addition to the above-mentioned time lag, another factor is that the scales are adjusted on the basis of inflation rate estimates. For more details on how legislators generally bring the income tax rate into line with inflation, see Deutsche Bundesbank (2022a). The top-income tax rate refers to the increase in the tax rate from 42% to 45% for the portion of taxable income that exceeds €277,825 for individually assessed taxpayers.

^{*} The structural figures are derived by adjusting for cyclical influences and special temporary effects (primarily crisis measures). For analytical purposes, 2023 was adjusted for a statistical reclassification: in 2023, local public transport was reassigned from the corporate sector to the general government sector. Due to this reclassification, general government revenue and expenditure in 2023 each rose by ¼% of GDP. This increase will appear only temporarily in the national accounts, as with the general revision in August, local public transport will be assigned to the general government sector for previous years, too. 1 Change in the ratio to GDP compared with previous year. 2 2023 breakdown estimated, as end-year debt level is not yet available. 3 The term "fiscal drag" encompasses the positive revenue effect of bracket creep in income taxation and the negative impact of the fact that specific excise duties are largely independent of prices. 4 Other current transfers receivable, sales and total capital revenue (excluding capital taxes). 5 Other current transfers payable, other net acquisitions of non-financial assets. 6 Year-on-year percentage change.

Deutsche Bundesbank

The major fluctuations in the tax ratio are largely the result of taxes on profits. In 2021 and 2022, after adjusting for legislative changes, they significantly outstripped trend growth in their macroeconomic reference variables (see item 8.4). However, a significant countermovement took hold in 2023, which partially offset excess growth. In 2023, other major types of tax such as wage tax and VAT also recorded weak growth. In fact, real estate acquisition tax revenue fell sharply (see p. 66 for more details).

In 2023, the ratio of other revenue was broadly in line with 2019. Although interest

income has risen significantly recently, the fact that the Bundesbank has not transferred any profits to central government since 2021 has reduced revenue.

The expenditure ratio increased noticeably in comparison to 2019. It initially rose sharply in the period leading up to 2021, when it reached its highest level since Germany's reunification, before falling again somewhat in 2022 and 2023. The main reason for this decline was that major expenditure categories are lagging behind inflation. Consequently, nominal trend GDP in the denominator of the ratio (see items 20 and 21) is growing faster than expenditure

in the numerator due to high inflation.8 Given that more and more expenditure is likely to catch up, the expenditure ratio is expected to rise again this year.

The rise in the expenditure ratio was mainly due to the significant increase in government spending on climate action. This was reflected in particular in higher capital transfers. These include grants from the Climate Fund for energy-efficient building refurbishment and e-mobility, for instance. The intermediate consumption ratio also grew strongly – especially in 2023.

Although the interest expenditure ratio is still low in a longer-term comparison, it started rising again for the first time in many years in 2022. This was due to inflation. Expenditure on inflation-linked securities increased considerably in 2022 and 2023 (see also p. 71). By contrast, the

higher debt ratio was virtually irrelevant for interest expenditure over the period as a whole. First, the debt ratio at the end of 2023 was no longer much higher than in 2019. Second, the rate of interest on new debt remained very low on average.

Social benefits and employee compensation ratios have declined considerably in recent years. These expenses largely adjust to significantly increased price levels only with a time lag.⁹ For instance, this applies to wages and salaries within the public sector, and to pension adjustments.

In addition, the debt ratio will need to fall by an average of ½ percentage point annually until it reaches the reference value of 60%. Seen from the present perspective, Germany will comply with these requirements. However, additional requirements could be imposed to make provisions for the increasing burdens related to population ageing. Overall, it is not yet entirely clear what exactly the reformed EU rules will mean for Germany.

Debt brake strengthened

Change in debt brake under discussion Following the ruling of the Federal Constitutional Court in November 2023, the binding effect of the German debt brake on fiscal policy is stronger once again. At present, there are various proposals to loosen the debt brake through amendments to Germany's constitution, or Basic Law. Some proposals aim to broaden the leeway for borrowing in general. Others want exclusively investment expenditure or trans-

formation tasks, for example, to be financed through additional debt. Two main approaches are being discussed: one in which the debt brake would be replaced by a golden rule again, and another in which an additional debt-financed special fund would be introduced in the Basic Law alongside the debt brake.

The Bundesbank considers effective fiscal rules important to safeguard sound government finances. Prior to the ruling of the Federal Constitutional Court, the debt brake had been softened by means of the escape clause. This is also why the Bundesbank was already considering in the spring of 2022 how the debt brake could be reformed in a way that would safeguard stability. The thinking was to have a rule with a stronger binding effect again and tie it to greater leeway for deficits. This also

With binding fiscal rules, somewhat broader leeway for borrowing is justifiable

⁸ Trend nominal GDP in the denominator of the ratio is calculated as the product of the unadjusted GDP deflator and the trend in real GDP.

⁹ For the effects of inflation on general government budgets in euro area countries, see Bańkowski et al. (2023).

⁵ See Deutsche Bundesbank (2022b).

⁶ This is very much in line with the latest proposals by the German Council of Economic Experts (2024).

The reform of the EU's fiscal rules

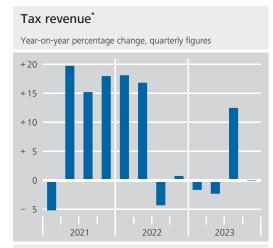

In December 2023, the Economic and Financial Affairs Council (ECOFIN) agreed on new regulations concerning the EU's fiscal rules. Although the new rules still have to be negotiated with the European Parliament and finalised, the basic principles underlying them have now been defined.

The ECOFIN agreement contains important fiscal anchors. For example, the fact that the 3% limit for the deficit ratio will be maintained and remain backed by sanctions is welcome. For Member States with deficit or debt ratios above the respective reference value, moreover, the new rules envisage a more ambitious budgetary objective than the 3% limit. These countries will be obliged to achieve a structural deficit ratio of no more than 1.5% over the medium term. Another welcome development is that foreseeable ageing-related costs are to be taken into account.

However, a number of aspects of the reform are problematic. These include the wide discretionary scope in many instances, and the fact that the annual budgetary limits rely on assumptions. The European Commission is to negotiate these assumptions bilaterally with each Member State. At the same time, the rules are very complicated. Even with great effort, third parties will struggle to follow how the final limits were agreed upon and whether they have been adhered to. This will make public discussion of how the rules are implemented more difficult, risking the loss of an important pillar of oversight. This, too, could encourage the setting of unambitious annual limits, which would delay any necessary consolidation.

Moreover, transitional provisions may decisively reduce the pace of consolidation in the coming years. For a transitional period following the launch of the new rules, some elements of the basic rules will be watered down. The present high debt ratios could thus become further entrenched or even rise

All in all, there is a risk that the new rules will barely contribute at all to the objective of sound public finances. Experience has shown that governments have little interest in being fiscally constrained by budgetary rules. The broad discretionary scope permitted in the rules' implementation plays into this tendency. This makes it all the more important for the European Commission and ECOFIN to translate the rules into ambitious requirements and press for Member State compliance. Only then are we likely to see a rapid fall in high debt ratios, in particular. Strict application of the rules would also boost capital markets' confidence in the soundness of public finances.

Source: Federal Ministry of Finance. * Comprises joint taxes as well as central government taxes and state government taxes. Including EU shares in German tax revenue, including customs duties, but excluding receipts from local government taxes. Deutsche Bundesbank

fits in with the current debate: German fiscal rules should prescribe budget ceilings to ensure that Germany generally complies with the 60% reference value for the debt ratio and that it returns to compliance swiftly if it overshoots this threshold. In this context, it would be possible to earmark some borrowing for certain government expenditure items. This could be done, for example, using a capped golden rule, as discussed by the Bundesbank, under which net government investment could be financed by borrowing up to a fixed ceiling.7 A special fund with its own credit limit in Germany's Basic Law could be designed in such a way that it expands the leeway for a deficit in a comparable way; in this respect it would not contradict these basic considerations. It should be borne in mind that Germany must, at the same time, comply with the EU budget rules. In other words, the tighter of the two sets of rules will determine the leeway for deficits.

Budgetary development of central, state and local government

Tax revenue

2023 as a whole

Tax revenue⁸ grew by 2% year on year in 2023, or €15 billion (see the adjacent chart and the table on p. 67). On the one hand, high inflation led to a significant increase in the macroeconomic reference variables for taxes. Additional revenue was also generated through progressive taxation. On the other hand, tax cuts markedly dampened the increase, which, overall, was €3 billion, or 0.3 percentage point lower than expected in the October tax estimate.⁹

Tax revenue increased moderately in 2023 – slightly undershooting official tax estimate

Wage tax revenue increased by 4%, or €9 billion. This increase was 3 percentage points lower than the growth in the relevant macroeconomic reference variable of gross wages and salaries. That is because, on balance, tax cuts outweighed the boosting effects of progressive taxation. Compared with 2022, the disappearance of energy price allowances (€10 billion) increased tax revenue. The allowances had been paid out of wage tax revenue for the most part. More significant, however, were permanent tax cuts. Above all, legislators adjusted the income tax scale to compensate for the high bracket creep of 2022. In addition, one-off wage payments were in many cases made in the form of tax-free inflation compensation bonuses. Last but not least, the significant increase in child benefits, which are paid out of wage tax revenue, had a dampening effect.

Tax cuts dampened wage tax revenue and ...

⁷ The cap is fundamental to a stability-oriented design; without it, there are strong incentives to broadly define where investment should go and thus undermine the rule. 8 Including EU shares in German tax revenue but excluding receipts from local government taxes, which are not yet known for the year.

⁹ For more details on the official tax estimate, see Deutsche Bundesbank (2023b), pp. 63 ff.

Deutsche Bundesbank

VAT revenue

In 2023, VAT receipts rose by only 21/2%, which was 3 percentage points less than nominal private consumption - its most important macroeconomic reference variable. Tax cuts significantly reduced growth here. These were mainly the temporarily lower tax rates on natural gas and district heating. In addition, it appears that tax revenue in 2022 might have been inflated owing to back-payments of taxes from the coronavirus crisis.

Decline in income tax and corporation tax, dvnamic arowth in investment income tax

On the whole, profit-related taxes moved sideways. Assessed income tax and corporation tax both recorded declines. In addition to weak real economic developments, legislative changes were also a factor in this. These legislative changes mainly concerned income tax, with the aforementioned compensation for bracket creep. By contrast, non-assessed taxes on earnings (in particular dividend taxation) and withholding tax on interest income and capital gains recorded dynamic growth.

The downturn in the real estate sector put a dampener on real estate acquisition tax, which flows into state budgets. Revenue was down by 29%, or €5 billion, compared with 2022.10 This reduced overall revenue growth by ½ percentage point.

Revenue from real estate acquisition tax down sharply

Tax estimate: significant

in 2024

revenue growth

Outlook for 2024

For the current year, the official tax estimate of last October expected tax revenue to rise more sharply than in 2023, with the macroeconomic reference variables developing somewhat less favourably. On balance, though, the shortfalls due to legislative changes are significantly lower than in 2023:

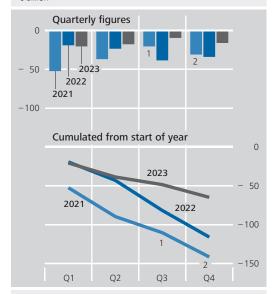

- At the beginning of 2024, legislators adjusted the income tax scale to a similar ex-

tent as in the previous year.

Fiscal balance of central government budget*

€ billion

Source: Bundesbank calculations based on data from the Federal Ministry of Finance. * Excluding off-budget entities. Not adjusted for financial transactions or cyclical effects. 1 The transfer of £16 billion from the core budget to the Flood Relief Fund was corrected by the removal of £14 billion in reserves following the Federal Constitutional Court's ruling in late 2023. 2 Excluding the transfer of £60 billion from the core budget to the Climate Fund, which the Federal Constitutional Court deemed unconstitutional in its ruling of 15 November 2023.

Deutsche Bundesbank

- In the area of indirect taxes, there is a net increase in revenue. Although electricity tax for the manufacturing sector fell to the European minimum rate, the reduction in VAT on food in restaurants came to an end at the beginning of 2024. Furthermore, VAT on natural gas and district heating is expected to rise again at the end of March.
- In addition, profit-related taxes are now generating additional revenue as a result of write-offs being made at an accelerated pace in recent years.
- The share of gross wages and salaries paid as tax and social contribution-exempt inflation compensation bonuses is likely to decline.

However, tax revenue is likely to be significantly lower than forecast in the latest official tax estimate. This is due, first of all, to lower revenue as a result of legislative changes implemented in the intervening period. The aforementioned reduction in electricity tax is particularly significant in this regard. There are also plans to further increase the income tax allowances. In addition, limited shortfalls may yet arise as a result of the Growth Opportunities Act (Wachstumschancengesetz), which is currently still the subject of a mediation procedure between the Bundestag and the Bundesrat. Second, the lower-than-expected tax revenue in 2023 is likely to partly spill over into 2024. Third, economic growth could be lower than assumed in autumn.

Central government finances

Overview for 2023: central government including off-budget entities

Central government's initial response to the ruling of the Federal Constitutional Court of November 2023 was to adopt a supplementary budget for 2023. This reduced the planned central government deficit (including off-budget entities) from an original €232 billion to €135 billion (see the table on p. 69, item 21). The deficit¹¹ was ultimately much lower still, at €88 billion (ibid.). The off-budget entities, in particular, closed the year more favourably than in the adjusted plans, especially the Climate Fund. In addition, special funds with no figures in the central government budget borrowing plan recorded considerable surpluses. Compared with 2022, the total central govern

2023: central government's overall deficit down substantially and lower than most recently envisaged

11 Besides the core budget, central government off-budget entities that use the single-entry system and for which data are already available are included here (see pp. 72 f.). These comprise, in particular, (i) the ESF-E, (ii) the off-budget entities relevant to the debt brake up to 2021, and (iii) the Armed Forces Fund (see the table on p. 69, items 16, 17 and 20). In addition, the reporting group for off-budget entities includes, above all, (iv) the other funds with figures in the central government budget borrowing plan (special funds for making provisions for redemptions and for extending childcare, item 18, ibid.), as well as (v) entities with no published borrowing plan figures (thus not counting towards the planned deficit), such as the precautionary fund for civil servants' pensions (item 19, ibid.). In particular, the bad bank FMSW, the fund for the disposal of nuclear energy waste, the motorway company and the development aid company GIZ are completely excluded.

Revenue expectations for 2024 noticeably lower than official tax estimate

Deutsche Bundesbank

ment deficit (including off-budget entities) decreased very sharply, going down by €59 billion. The deficit fell mainly in the core budget.

2023: Federal Constitutional Court ruling necessitated budget revision

Revision of 2023 budget plan necessary after ruling Central government had to revise its budget plans for 2023 on account of the Federal Constitutional Court's ruling. The budget plans had originally set aside extensive reserves from emergency borrowing for the Climate Fund, the ESF-E and the 2021 Flood Relief Fund. Central government scrapped the transfer of €60 billion, which had been deemed unconstitutional, to the reserve of the Climate Fund, and fully scrapped the reserves of the other two funds. Subsequently, it envisaged borrowing under the escape clause in the ESF-E and in the core budget for the Flood Relief Fund, replacing previously planned withdrawals from reserves. A need for adjustment was also identified in the core budget, as the calculated cyclical burden was €10 billion lower in the current projection.12 To offset this, the supplementary budget contains, in particular, larger global spending cuts, additional withdrawals from reserves, and lower interest expenditure.

2023: core budget outturn

2023 budget outturn: more favourable than estimated in supplementary budget The core budget closed the year with a deficit of €65 billion – an improvement of €6½ billion on the supplementary budget. Revenue exceeded the planned figure by €2½ billion (see the table on p. 69, item 2). Overall, expenditure remained €4 billion below budget estimates, particularly in the case of investments, other operating expenditure and transfers to enterprises. The target-actual deviations for individual budget items are remarkable: as central government only finalised adjustments within the supplementary budget shortly before the end of the year, more accurate estimates would actually have been expected here. Instead, the supplementary budget still contained large global spending cuts (item 1.b, ibid.).

The deficit in the core budget fell sharply year on year, by €51 billion. Revenue rose substantially, by 6½% (+€26 billion). 13 In addition to higher tax revenue, this was due, not least, to receipts of €4 billion from the EU debt-financed Next Generation EU (NGEU) off-budget entity. Total expenditure, by contrast, decreased by a significant 5% (-€25 billion), chiefly on account of the fact that pandemic-related spending - on the statutory health insurance scheme and business aid, for example - came to an end. This outweighed the marked increase in interest expenditure (+€22 billion). Of this increase, €16 billion was attributable to discounts alone (see also the box on p. 71). Additional spending of €5½ billion on the reformed civic allowance was also a considerable factor.

Debt brake accounting for 2023 is proving rather complicated. The plan was to exceed the net borrowing ceiling in the core budget by €1.7 billion by making payments to the Flood Relief Fund under the escape clause. On balance, however, the deficit was now €6.6 billion lower. Moreover, the net borrowing permitted under the debt brake is €1.5 billion higher because a cyclical burden that was higher by this amount was calculated. 14 On the other hand, €6.3 billion less was withdrawn from the reserves than envisaged, and coin seigniorage remained a little below estimates. On balance, therefore, the debt brake limit was slightly undershot in arithmetical terms (by just under €0.2 billion, based on mid-January data). In its debt brake accounting, however, the government counted the transfer to the 2021 Flood

by €6½ billion

¹² According to the government's projection from the autumn of 2023, nominal GDP rose somewhat more strongly on account of inflation than in the autumn 2022 projection, which was the basis for the original budget plan for 2023. Factoring in the acceleration in nominal growth, central government's cyclical adjustment procedure calculated a much less unfavourable cyclical effect on the 2023 central government budget. The scope for borrowing under the debt brake decreased accordingly.

¹³ As per the definition in the government finance statistics, which includes gross tax revenue, revenue and expenditure in the following differ from revenue and expenditure in the table on p. 69.

¹⁴ This was due to slightly lower nominal GDP growth as calculated using the data available in mid-January.

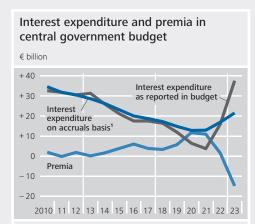

The steep rise in central government interest expenditure

Interest expenditure decreased for a long time in the low interest rate environment, reaching a low of €3½ billion in the 2021 central government budget. It rose sharply thereafter, hitting €38 billion last year.

But this is not the result of higher borrowing costs. The ECB Governing Council did raise key interest rates by 4½ percentage points, and capital market interest rates – the rates that are relevant for central government also rose significantly in the wake thereof. However, the resulting effective additional interest burden on central government in the 2023 financial year remained limited. Specifically, the relevant bonds newly issued in 2022 accounted for only a small part of central government debt (around €350 billion). The underlying interest rate (interest cost rate according to the 2022 borrowing report) remained relatively low, at 1.0%. Compared with the interest paid on matured debt instruments, which was very low on balance, this resulted in additional annual interest expenditure (on an accruals basis) of just under €3½ billion (of which just over €1 billion was for net borrowing from 2022).1

This means that there are other reasons for the decidedly steep rise in interest expenditure. A significant contribution comes from provisions for redemptions of inflation-indexed debt instruments. While the relevant payments are not made until the debt instruments mature, central government makes provisions by recording the annual inflation-driven redemption increase as interest expenditure and setting this amount aside. With inflation-indexed Federal securities worth around €70 billion, interest expenditure of €8 billion was recorded in the core budget last year, compared with just over €½ billion in 2021.

The Bundesbank has repeatedly proposed allocating premia and discounts on an accruals basis² – as in the national accounts. This would smooth out interest expenditure considerably. Fiscal policy would potentially be stabilised and the structural situation better captured. This would also make sense with regard to the debt brake: the ceiling should refer to a value that reflects the structural budget situation.

Sources: Federal Ministry of Finance and Bundesbank estimates.

1 Approximated according to Federal Ministry of Finance's 2022 borrowing report. Besides premia, other components of interest expenditure (incl. accrued interest) are allocated on an accruals basis. Value for 2023 estimated.

Deutsche Bundesbank

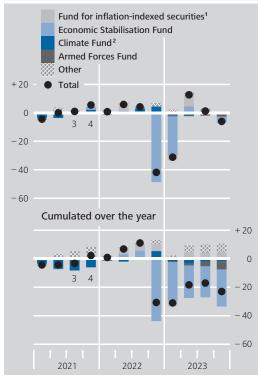

What ultimately play a decisive role are discounts on the par value of newly issued debt instruments. As central government aims for each series of debt securities to be high in volume in order to secure the accompanying interest rate advantages, it sometimes opts for tap issues for an extended period of time. Tap issues of long-dated bonds may be priced at a large discount when interest rates are on the rise. For the series with a 30-year term and a coupon of 0%, discounts sometimes amounted to around half of the bonds' par value. As the central government budget does not allocate these discounts over the bonds' term, i.e. it does not record them on an accruals basis, they place an enormous burden on interest expenditure in the year of issue. They amounted to €15 billion in 2023. Compared with 2021, a year of large premia, interest expenditure thus rose by almost €26 bil-

¹ Refinancing from 2021 had still been easing the burden on the central government budget in the 2022 financial year.

² See, for example, Deutsche Bundesbank (2021).

Fiscal balances of central government's off-budget entities*

Relief Fund (Actual: just under €1.4 billion) as having been financed by means of emergency

Deutsche Bundesbank

borrowing via the escape clause.¹⁵ For this reason, the future repayment requirement for emergency borrowing also additionally increases by this amount. Adjusted for the transfer to the Flood Relief Fund recorded in this way, the outturn was then just over €1.5 billion below the ceiling, and this amount is planned to be credited to the control account.

2023: budget outturn for off-budget entities

Central government's off-budget entities¹6 closed 2023 with a deficit of €23 billion (see the adjacent chart), making them a considerable €41 billion better off than envisaged back in December 2023. In 2022, the deficit stood at €31 billion.

2023 budget outturn for offbudget entities: large deficit, particularly in ESF-E; planned figures significantly undershot overall

- The ESF-E recorded a deficit of almost €42 billion – €11 billion more than in the previous year. In addition to the transfers, particularly under the electricity and gas price brakes, interest expenditure of €2½ billion was also incurred. The outturn was just over €1½ billion more favourable than envisaged in the supplementary budget. The government financed the deficit with additional emergency borrowing via the escape clause. However, the outstanding repayment burden from emergency borrowing is now considerably lower than at the end of 2022 owing to the removal of reserves from the books. Actual outflows were only one-third of the level budgeted at that time in the ESF-E's economic plan for 2023. Lower contract prices set by utility companies brought down spending on energy price brakes particularly extensively. In addition, large planned capital injections to gas trading company Uniper were not required. Supplementary energy price assistance played a negligible role, with the exception of in the hospital sector. The rest of the ESF recorded a surplus of €15 billion from repaid aid loans, following a deficit of €13 billion in 2022.
- The Climate Fund posted a deficit of €1½ billion, which was financed from the remaining reserves. This is only a moderate deterioration on the previous year if the core budget transfer of €6 billion, which was posted as revenue in 2022, is factored out.

¹⁵ See Federal Ministry of Finance (2024), pp. 26 f.

¹⁶ According to data from the Federal Ministry of Finance, i.e. excluding bad banks and other entities that use commercial double-entry bookkeeping.

Vis-à-vis the deficit of €14 billion in the economic plan, additional revenue of €2½ billion from carbon emissions certificates brought some relief. What was far more important, however, was that actual outflows were once again only just over half of the level budgeted.

 The Precautionary Fund for Redemptions (for inflation-indexed Federal securities) and the civil servants' pension fund recorded surpluses of €4½ billion and €3½ billion, respectively. The Financial Market Stabilisation Fund (SoFFin) posted a surplus of €4½ billion, mainly from loan repayments.¹⁷

2024 overview: central government and off-budget entities

2024: total deficit of €101 billion planned For the current year, the plans for central government and its off-budget entities foresee a deficit of €101 billion (see the table on p. 69, item 21).¹8 Of this amount, €52 billion is attributable to off-budget entities, predominantly the Climate Fund and the Armed Forces Fund. The Climate Fund is to finance its deficit from reserves, while the Armed Forces Fund is exempt from the debt brake. For the first time since 2020, central government thus plans to make no recourse to emergency borrowing via the escape clause.¹9

2024: plan for the core budget

Much larger core budget deficit than envisaged back in summer Following the ruling of the Federal Constitutional Court, legislators made significant adjustments to the draft budget for 2024 drawn up last summer. In the core budget, the deficit now amounts to just over €49 billion. As in the summer draft budget, net borrowing is therefore at precisely the same level as the calculated upper limit of the debt brake. However, the deficit is €31 billion higher than originally planned (see the table on p. 69, item 3). This is due to several factors:

 The acquisition of additional financial assets make it possible to increase net borrowing by \le 16 billion (item 8, ibid.). These include a loan of \le 12 billion for the generational capital fund²⁰ and a capital injection of \le 4½ billion to Deutsche Bahn for the railway network.²¹

- In addition, according to the autumn projection, the cyclical component enables net borrowing to increase by just under €5½ billion (item 7).
- Since the Budget Act (Haushaltsgesetz) was adopted in the new year, the credit limit is based on nominal GDP in 2023. The lower GDP of 2022 (the last year prior to the Budget Act) would otherwise have been used as a basis. As a result, the ceiling is €1 billion higher (item 13).

17 This reflected the fact that the bad bank FMSW reduced its debt to the fund and therefore ultimately decreased consolidated central government debt, too. FMSW has been refinancing itself through SoFFin for a number of years now. SoFFin's resulting deficits did not increase central government debt overall, and were thus excluded from the balance of off-budget entities. Surpluses from repayments, however, reduce central government debt and are included for this reason.

18 The deficit is expected to rise from €88 billion (Actual 2023) to €101 billion. The increase is due to the fact that entities such as, in particular, the remainder of the ESF (decoupled from the ESF-E) posted a surplus of €24 billion on balance in 2023 (see the table on p. 69, item 19), but there are no figures for these entities in the central government budget plan for 2024. Adjusted for these specific off-budget entities, there is a moderate decline in the deficit.

19 However, it was signalled that this should be reviewed in the event of a major change, especially with regard to German aid for Ukraine. In addition, a smaller group of experts (from the Federal Court of Auditors, inter alia) expressed at a hearing before the Budget Committee their opinion that in the wake of the Federal Constitutional Court ruling, the debt brake should be settled again as it was prior to the introduction of a new accounting method for special funds in early 2022. According to this accounting method, even the approved budget would already exceed the debt brake limit (see the table on p. 69, item 12).

21 The capital injection replaces investment grants from the Climate Fund and thus protects its remaining reserves. However, to date, the national accounts have not recorded such capital injections to Deutsche Bahn as financial transactions, but rather as affecting the deficit. Additional information: In the national accounts, there are plans to reassign Deutsche Bahn, in large part, to the general government sector. Instead of the capital injection, the fiscal balance of these parts of Deutsche Bahn would then play a role in the central government deficit.

- Furthermore, with an additional €9 billion, central government absorbs almost all of the remaining reserves in the core budget. Of this amount, €6½ billion stems from the better-than-planned budget outturn for 2023 (item 5).

Overall, the finalised plans for the current year ESF-E dissolved; yield a deficit of €52 billion for the off-budget entities.²² Compared with the plans made back in summer, the most significant change is that the ESF-E was dissolved at the end of 2023. The energy price brakes expired at that point in time, and the core budget assumed the outstanding burdens, in particular the interest burden. As in the summer of 2023, sizeable deficits are planned for the other two large special

otherwise only limited changes to government plans from summer

Core budget deficit projected to decline, but mainly due to special effects

The planned deficit in the core budget is thus €15 billion lower than the Actual 2023 figure. The credit-financed loan for the generational capital fund will increase the budget deficit, but a loan of €6½ billion to the International Monetary Fund will not be paid out again. In addition, follow-on pandemic burdens from 2023 will disappear. Interest expenditure will also fall as it includes a €12 billion reduction in burdens from discounts and inflation-indexed Federal securities. Furthermore, central government will shift expenditure into off-budget entities (not least military expenditure into the Armed Forces Fund) and use the Digitalisation Fund's reserve of €4 billion in the core budget. Aside from this, it will cut its grants to the pension insurance scheme by €1 billion.

2024: plans for the off-budget entities

No net borrowing for offbudget entities under debt brake, but reserve-financed deficits persist

According to its accounting method, central government will also be in compliance with the debt brake when including its off-budget entities. Borrowing is only anticipated for the Armed Forces Fund (see the table on p. 69, item 20), which is exempt from the debt brake. The other special funds are to finance their (in some cases considerable) deficits from their reserves. This applies, in particular, to the Climate Fund (item 17.a). However, the majority of the reserves concerned could only be formed by the government because borrowing authorisations were transferred from the core budget when the escape clause was activated. From an economic perspective, there are parallels with the reserves that had to be removed from the books following the ruling of the Federal Constitutional Court. The Federal Government apparently sees no legal conflict here, though.

 A deficit of €20 billion is estimated for the Armed Forces Fund. As planned back in summer, the fund is expected to cover the majority of procurement expenditure from the core budget. In addition, replacement purchases of €½ billion were estimated for materials delivered to Ukraine by the German armed forces.

funds.

- A deficit of €29 billion is estimated for the Climate Fund – only €½ billion less than envisaged in the summer of 2023. Legislators made much steeper expenditure cuts, but the estimated €9½ billion global increase in revenue envisaged in summer did not materialise. Meanwhile, the additional increase in the price of national carbon emissions certificates (€5 higher per tonne) will only generate additional revenue of €1½ billion. The court ruling directly reduced the fund's reserves by €60 billion. At year-end 2023, the government still recorded reserves of €29 billion. These are expected to be almost entirely exhausted this year. However, the medium-term plan from summer 2023 foresaw a deficit of €28 billion for 2025 as well. There is therefore still a considerable need for adjustment.
- The far smaller Digitalisation Fund is returning its remaining reserves to the core budget. It will thus post a deficit of €4 billion.

²² Surpluses are to be expected again for the special funds for which the central government budget does not report planned fiscal balances, including, for example, the civil servants' pension fund and the COVID-19 arm of the ESF.

State government budgets²³

2023 as a whole

Core state government budgets with a slight deficit in 2023 – considerable deterioration on 2022 The balance of state government core budgets saw a considerable deterioration of €15 billion last year. As the state governments had still posted a large surplus in 2022, however, they closed 2023 with only a slight deficit.²⁴

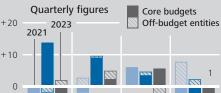

Decline in revenue set against moderate rise in expenditure Revenue fell by 2% (-€9 billion). Tax revenue declined by 1%. Collapsing revenue from real estate acquisition tax accruing to state governments placed a particular strain on their budgets (see p. 67). In addition, revenue from public administrations was 8% lower than in the previous year. These receipts had previously risen sharply due to central government channelling coronavirus aid through state government budgets (mainly transfers to enterprises). The corresponding state government expenditure then likewise fell. Nonetheless, total expenditure climbed by 1% (+€5 billion).²⁵

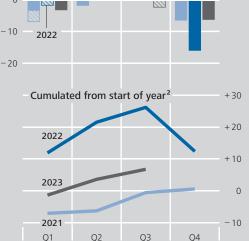

Including offbudget entities, state governments may have closed 2023 broadly in balance Including their off-budget entities, state governments may have closed 2023 broadly in balance (2022: surplus of €16 billion²⁶). However, data for the year as a whole are not yet available. After three quarters, the balance for core budgets and off-budget entities combined was €19 billion less favourable than in the previous year.

Outlook for 2024

Deficit to be expected for state governments this year State government finances could deteriorate this year. Although state government taxes are likely to grow markedly, expenditure will probably rise more strongly than revenue. Price increases are still having a broad impact. The wage settlement of December 2023, together with comparable adjustments to civil servant salaries, entails a substantial increase in personnel expenditure. Furthermore, state governments intend to continue recruiting more staff. By comparison, transfers to local government are likely to increase more slowly — in line with the weak tax developments of the previous year, in particular.

State government fiscal balance € billion

Sources: Federal Statistical Office and Bundesbank calculations. **1** Figure calculated using monthly cash statistics on the core budgets from the Federal Ministry of Finance; quarterly data, which also encompass data on the off-budget entities, are not yet available. **2** Core budgets and off-budget entities together. Deutsche Bundesbank

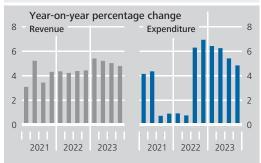

Impact of the Federal Constitutional Court's ruling on state governments

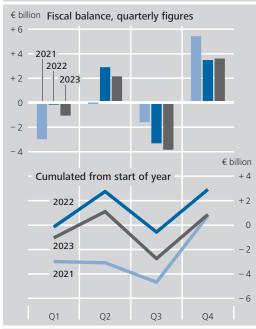

Many state governments made use of emergency borrowing during the pandemic to build up reserves for expenditure in subsequent years. An official overview of their size is not

State governments have large reserves from emergency borrowing

- **23** The information on the core budgets is based on the monthly cash statistics.
- 24 At the beginning of 2023, the monthly cash statistics showed a surplus of €14 billion for 2022 in the core budgets, whereas the cumulative quarterly data in mid-2023 only put this figure at just over €10 billion. It seems that individual state governments retroactively booked transfers to off-budget entities and thus shifted borrowing authorisations. In view of the Federal Constitutional Court's ruling in November, it appears possible that they may reverse some of these bookings.
- 25 In 2022, central government transferred funds of around €19 billion to state governments for coronavirus aid, which the state governments then forwarded. After adjustment for these central government transfers, state government expenditure rose by around 5%. Since the state governments had also used some of their own funds for coronavirus response measures in 2022 (which were absent in 2023), the fully adjusted rate is even higher.
- **26** Adjusted for missing revenue entries amounting to €3½ billion in Saarland. See Deutsche Bundesbank (2023d), p. 41.

Source: German statutory pension insurance scheme (Deutsche Rentenversicherung Bund). * Preliminary quarterly figures. The final annual figures differ from the total of the reported quarterly figures as the latter are not revised.

Deutsche Bundesbank

available. The Bundesbank performed makeshift calculations to gauge their volume as at year-end 2022.²⁷ In 2023, some state governments were still planning to build up additional reserves until the Federal Constitutional Court's ruling in November. If these are taken into account, the reserves from emergency borrowing might have stood at around €30 billion at this point in time.

The Federal Constitutional Court's ruling states that emergency borrowing cannot be used over multiple years. This means that state governments have to adjust their plans if they include the use of such reserves. Brandenburg, Bremen, Saarland, Saxony-Anhalt and Schleswig-Holstein, for example, all declared another state of emergency following the ruling, thus justifying the use of emergency borrowing. This mostly also applies to the current year. An alternative course of action is to release reserves financed through emergency borrowing. For instance, Mecklenburg-West Pomerania dissolved a special fund that it had previously filled with funds from emergency borrowing. Adjustments are likely to follow in other federal states, too.

Social security funds

Pension insurance scheme

2023 as a whole

The statutory pension insurance scheme recorded a surplus of €1 billion in 2023 (preliminary data). This was €2½ billion lower than in the previous year. Thanks to the surplus, the sustainability reserve was up to €45 billion at the end of 2023, leaving it at just under €40 billion above the statutory minimum.

Reduced surplus in 2023, further increase in reserves

Total revenue rose by 5%. At 5½%, growth in contribution receipts was somewhat stronger, even though a large volume of tax and social contribution-exempt inflation compensation bonuses were paid out to employees. Expenditure rose at a slightly higher rate (5½%) than revenue. On average across the year, pensions increased by 5%.²⁸ The number of pensions continued to experience only moderate growth.

Substantial rise in contribution receipts and pensions

Outlook for 2024

The pension insurance scheme's finances will probably remain almost unchanged this year. Expenditure is likely to rise to a similar extent as in 2023. The significant pension increase of

Federal Constitutional Court's ruling restricts reserves for state governments, too

Higher retirement age alleviates demographic burdens

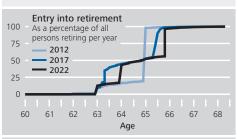

The Federal Government is preparing a reform of the statutory pension insurance scheme which would see the replacement rate remain at the current level of 48% until 2039. Under existing legislation, the replacement rate is set to decline after 2025. Such a reform therefore puts additional pressure on the contribution rate to the statutory pension insurance scheme and on central government finances. The Federal Government does not intend to raise the statutory retirement age any further after 2030, at which point it will remain at 67 years. However, the planned higher pensions would be much easier to fund if the retirement age were linked to life expectancy as of 2031. If people enter retirement later, this boosts employment, economic growth and individual pension benefits calculated on the basis of income from employment. At the same time, a larger contribution base makes it easier to finance pensions, which also eases the burden on other branches of social security and the federal budget. A number of national and international bodies therefore recommend that Germany introduce such a link.1

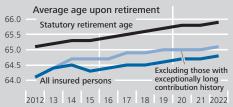

Data² from the statutory pension insurance scheme show how insured persons are adjusting to a higher statutory retirement age, with the actual retirement age following the statutory retirement age fairly closely³:

 A large proportion of insured persons enter retirement upon reaching the applicable statutory retirement age (see the upper part of the adjacent chart). The statutory retirement age was 65 in 2012 and has been gradually rising since then; in 2022 it was just under 66 years.

- The introduction of a deduction-free pension from the age of 63 for qualifying individuals led to a large reduction in the number of people retiring at the statutory retirement age. In 2012, around 80% of newly retiring old-age pensioners retired at the statutory retirement age, but by 2022 this figure had fallen to 40%.
- The deduction-free pension as of the age of 63 was introduced as a special provision for people with an exceptionally long pension contribution history of at least 45 years. It was launched in mid-2014. Initially, it was possible to draw on a deduction-free pension as of the age of 63. By 2022, the minimum age had risen to 64. The introduction of this deduction-free pension saw a surge in the proportion of people retiring early. Up to the current end,

Sources: FDZ-RV and German statutory pension insurance scheme (Deutsche Rentenversicherung). *Persons accessing the following types of pension are not taken into account: pension for persons with reduced earning capacity, old-age pension for disabled persons (Section 37 of the Sixth Book of the Social Security Code (Sozialgesetzbuch VI – SGB VI), old-age pension due to unemployment (Section 237 of the Sixth Book of the Social Security Code) and old-age pension for women (Section 237a of the Sixth Book of the Social Security Code). In addition, persons entering retirement were only included if drawing on an old-age pension for the first time.

¹ The German Council of Economic Experts has called for this again recently; see German Council of Economic Experts (2023), chapter 5, pp. 21 ff.

² See FDZ-RV – Forschungsdatenzentrum der Rentenversicherung (2012, 2017, 2022).

³ At the same time, the data do not provide any indication that insured persons are becoming more willing to accept deductions to their pensions on account of the rising retirement age, or that pensions are lower as a result. The average number of months between actual retirement and the statutory retirement age has remained broadly unchanged since 2012.

those entering retirement on this basis have made up a relatively high share of all new pensioners, at around 30%. At the same time, the age at which the bulk of early retirees enter retirement has gradually risen, mirroring the likewise increasing minimum age for a deduction-free pension (see the lines for 2017 and 2022 in the upper part of the chart, for example). It appears that a fairly small proportion of insured persons still retire as early as possible (at the age of 63) and accept pension deductions in return.

All in all, the introduction of the deductionfree pension at the age of 63 led to an initial marked reduction in the effective average retirement age (see the lower part of the chart). Over the remainder of the period under review, too, the possibility of drawing a deduction-free pension dampened the increase in the effective average retirement age, which only increased by just over ½ year from 2012 to 2022. Excluding those with an exceptionally long contribution history, the effective average retirement age in 2022 was just over 65 years, which – much like the statutory retirement age – is one year higher than in 2012.

Other data from the German statutory pension insurance scheme show that the share of insured persons receiving a pension for reduced earning capacity prior to the statutory retirement age has not risen over the same period.⁴ In this respect, the data do not reveal any impact of the significant rise in the size of the pension for reduced earnings capacity. The relatively stable share of people drawing on such a pension is consistent with studies showing that higher life expectancy, on the whole, goes hand in hand with better health at a given age.⁵

4 See German statutory pension insurance scheme (2023).

5 See Deutsche Bundesbank (2019), p. 74.

Finances largely unchanged in 2024: substantial rise in expenditure and ...

mid-2023 will make itself felt until mid-2024 (nationwide average of just over 4½%). According to the 2023 pension insurance report, pensions could increase more weakly in mid-2024, by 3½%. However, the number of pensions is expected to grow somewhat more strongly than in the previous year. Furthermore, expenditure will go up due to the fact that those who entered retirement owing to a reduction in earning capacity between 2001 and 2018 are to receive a blanket rise in pensions from mid-2024 onwards (almost €1½ billion).

Contribution receipts are likely to grow substantially. Relatively high wage increases are on the cards, and tax and social contribution-exempt inflation compensation bonuses are likely to play a somewhat less significant role. Central government grants are largely tied to wage developments in 2022 and would increase by around 5% this year. However, cen-

tral government is cutting these grants by just

over €1 billion in order to ease the burden on its own budget.²⁹

The pension insurance scheme should be financed in a way that is transparent and readily comprehensible. It would therefore be advisable to have a rule-based system for providing central government grants that is not dependent on central government's current budgetary situation.³⁰ Rather, central government should name and quantify benefits that it deems not to be contribution-related. These benefits would need be financed from central government grants. Any further central government grants for the general stabilisation of the pension insurance scheme would then be easy to identify.

Advisable: rulebased alignment of central government grants with noncontributionrelated benefits

29 It is already a legal requirement for central government grants to be reduced by €600 million per year between 2024 and 2027. The Bundesrat has not yet approved the plan to cut them by a further €600 million per year in the same period.

30 This was also argued recently by the Social Advisory Council (2023).

... revenue; central government arants cut

Longer-term outlook

Growing demographic burdens: sharp rise in contribution rate, although replacement rate to decrease significantly after 2025

From the mid-2020s onwards, the demographic financing pressures on the pension insurance scheme will grow significantly. This was made clear, not least, by the pension insurance report published by the Federal Government at the end of 2023. According to this report, the contribution rate will jump to 19.9% in 2029 and will rise further to 21.1% by the end of the simulation in 2037. The contribution rate currently stands at 18.6%. The replacement rate is a key metric for expenditure. This will remain stable at 48% until 2025. Under current legislation, the 48% minimum threshold will expire at the end of 2025. The replacement rate will subsequently decline significantly to 45% by 2037.

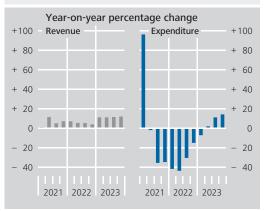

Announced extension of minimum threshold for replacement rate would considerably intensify financing pressures However, the Federal Government has announced its intention to extend the minimum threshold for the replacement rate until 2039.³¹ This would significantly increase the financing pressures on the pension insurance scheme: the contribution rate would then be likely to rise by almost 2 percentage points more in the period up to 2040. The resulting increase in central government grants would place additional pressure on the central government budget. The generational capital fund also planned by the Federal Government will probably do little to change this.³²

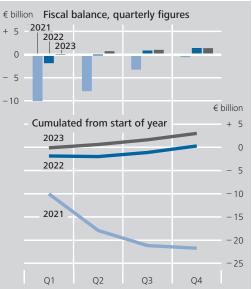

Federal Employment Agency

2023 as a whole

2023: Federal Employment Agency with significant surplus due to higher contribution rate In 2023, the Federal Employment Agency posted a surplus of €3 billion.³³ This constituted a year-on-year improvement of just over €2½ billion. This was mainly due to the fact that federal legislators had raised the contribution rate to the unemployment insurance scheme by 0.2 percentage point to 2.6% at the beginning of the year. This generated additional revenue of almost €3 billion. The core budget, which is financed by contributions,

Finances of the Federal Employment Agency*

Source: Federal Employment Agency. * Including transfers to the civil servants' pension fund and before payment of central government grants.

Deutsche Bundesbank

posted a surplus of €3½ billion. From this surplus, the Federal Employment Agency repaid a central government loan of €½ billion from 2022 and transferred the remainder to its free reserves, which it had used up during the coronavirus crisis. Taken together, the pay-asyou-go benefit areas of insolvency benefit and

³¹ See Federal Government of Germany (2023). The coalition agreement envisaged a permanent minimum threshold.

³² See Deutsche Bundesbank (2023c) for information on long-term projections and the generational capital fund. **33** In the core budget, i.e. excluding the civil servants' pension fund. Transfers to the fund lower the core budget balance. The civil servants' pension fund posted a broadly balanced budget, following a deficit of €½ billion in 2022. At the end of 2023, its funds amounted to €8 billion.

winter employment compensation posted a deficit of €½ billion in 2023. Their reserves stood at just under €3 billion at the end of the year.

Somewhat smaller surplus planned for 2024

Revenue up very sharply

The Federal Employment Agency's revenue rose very sharply, by 12%. Meanwhile, the pace of growth in contribution receipts was somewhat faster still, at 14%. Just under 9 percentage points of this rise was attributable to the higher contribution rate. Growth in overall revenue was dampened markedly by the fall of one-third in the insolvency benefit contribution rate, to 0.06%.

ticipating a surplus of €2 billion in its core budget. Its planned revenue is 5½% higher than the 2023 annual figure. On the expenditure side, outlays are expected to increase by a total of 9% compared with the previous year's figure. Spending on unemployment benefits, a major expenditure item, is projected to increase by 5½%. In addition, the Federal Employment Agency expects its expenditure on active labour market policy to be substantially higher (+20%, or +€1½ billion). Furthermore, it plans to transfer an additional €½ billion to the civil servants' pension fund.³⁴

Planned surplus still plausible

Significant expenditure growth

At +4½%, expenditure was significantly higher than in the previous year. Spending on unemployment benefits rose by 13%. Although the decline in expenditure on short-time work (-74%) largely offset this increase, outlays for active labour market policy grew by 7%. Spending on insolvency benefit rose sharply, by €½ billion, starting from a comparatively low level in the previous year. The Federal Employment Agency resumed the transfer to its civil servants' pension fund (€½ billion). These transfers had been suspended between 2020 and 2022.

As things stand, the planned surplus of the Federal Employment Agency appears plausible. The economic slowdown now seems likely to last for a somewhat longer period. As a result, labour market developments are also expected to be somewhat less favourable than was assumed in the autumn of 2023. This will put pressure on the Federal Employment Agency's finances in comparison with its plans. However, the Federal Employment Agency has traditionally tended to have quite generous expenditure appropriations for active labour market policy, which means that the planned balance should still be achievable.

Outlook for 2024

The Federal Employment Agency expects its finances to deteriorate somewhat this year, an-

34 The allocation rate rose in 2024. It increased from 96.6% to 147.7% of civil servants' pensionable remuneration.

euro banknotes put into circulation by the Bundesbank in accordance with the accounting regime chosen by the Eurosystem (see also footnote 2 on banknote circulation in Table III.2). The volume of currency actually put into circulation by the

Bundesbank can be calculated by adding to this total the item "Intra-Eurosystem liability/claim related to banknote issue" (see "Other liability items"). 5 Excluding central governments' deposits. 6 In Germany, only savings deposits.

^{*} Monetary financial institutions (MFIs) comprise banks (including building and loan associations), money market funds, and the European Central Bank and national central banks (the Eurosystem). 1 Source: ECB. 2 In Germany, only savings deposits. 3 Excluding holdings of MFIs; for the German contribution, excluding German MFIs' portfolios of securities issued by MFIs in the euro area. 4 In Germany, bank debt securities with maturities of up to one year are classed as money market paper.

⁵ Excluding liabilities arising from securities issued. **6** After deduction of inter-MFI participations. **7** The German contributions to the Eurosystem's monetary aggregates should on no account be interpreted as national monetary aggregates and are therefore not comparable with the erstwhile German money stocks M1, M2 or M3. B Including DEM banknotes still in circulation (see also footnote 4 on p. 10*). **9** For the German contribution, the difference between the volume of euro banknotes

Discrepancies may arise from rounding. * The banking system's liquidity position is defined as the current account holdings in euro of euro area credit institutions with the Eurosystem. Amounts are derived from the consolidated financial statement of the Eurosystem and the financial statement of the Bundesbank. 1 Figures are daily average for the reserve maintenance period ending in the month indicated. Following the changeover in the frequency of Governing Council monetary policy meetings to a six-week cycle, a reserve maintenance period no longer ends in every month. No figures

are available in such cases. **2** Source: ECB. **3** Includes liquidity provided under the Eurosystem's asset purchase programmes. **4** From August 2009 includes liquidity absorbed as a result of the Eurosystem's foreign exchange swap operations. **5** From 2002 euro banknotes and other banknotes which have been issued by the national central banks of the Eurosystem and which are still in circulation. In accordance with the accounting procedure chosen by the Eurosystem for the issue of euro banknotes, a share of 8% of the total value of the euro banknotes in circulation is

15°

allocated to the ECB on a monthly basis. The counterpart of this adjustment is shown under "Other factors". The remaining 92% of the value of the euro banknotes in circulation is allocated, likewise on a monthly basis, to the NCBs, with each NCB showing in its balance sheet the share of the euro banknotes issued corresponding to its paid-up share in the ECB's capital. The difference between the value of the euro banknotes allocated to an NCB and the value of the euro banknotes which that NCB has put into circulation is likewise shown under "Other factors". From 2003 euro

banknotes only. **6** Remaining items in the consolidated financial statement of the Eurosystem and the financial statement of the Bundesbank. **7** Equal to the difference between the sum of liquidity-pro viding factors and the sum of liquidity-absorbing factors. **8** Calculated as the sum of the "Deposit facility", "Banknotes in circulation" and "Credit institutions' current account balances".

^{*} The consolidated financial statement of the Eurosystem comprises the financial statement of the European Central Bank (ECB) and the financial statements of the national central banks of the euro area Member States (NCBs). The balance sheet items for foreign currency, securities, gold and financial instruments are valued at market

rates at the end of the quarrter. 1 In accordance with the accounting procedure chosen by the Eurosystem for the issue of euro banknotes, a share of 8% of the total value of the euro banknotes in circulation is allocated to the ECB on a monthy basis. The counterpart of this adjustment is disclosed as an "Intra-Eurosystem liability related to

euro banknote issue". The remaining 92% of the value of the euro banknotes in circulation is allocated, likewise on an monthly basis, to the NCBs, with each NCB showing in its balance sheet the share of the euro banknotes issued corresponding to its paid-up share in the ECB's capital. The difference between the value of the euro

banknotes allocated to the NCB according to the aforementioned accounting procedure and the value of euro banknotes put into circulation is also disclosed as an "Intra-Eurosystem claim/liability related to banknote issue". **2** For the Deutsche Bundesbank: including DEM banknotes still in circulation. **3** Source: ECB.

3 In Germany, debt securities with maturities of up to one year are classed as money market paper; up to the January 2002 Monthly Report they were published together

with money market fund shares. 4 Statistical breaks have been eliminated from the flow figures (see also footnote * in Table II.1).

^{*} Assets and liabilities of monetary financial institutions (MFIs) in Germany. The assets and liabilities of foreign branches, of money market funds (which are also classified as MFIs) and of the Bundesbank are not included. For the definitions of the respective items, see the footnotes to Table IV.3. 1 Owing to the Act Modernising Accounting Law (Gesetz zur Modernisierung des Bilanzrechts) of 25 May 2009, derivative financial instruments in the trading portfolio (trading portfolio derivatives) within the meaning of

Section 340e (3) sentence 1 of the German Commercial Code (Handelsgesetzbuch) read in conjunction with Section 35 (1) number 1a of the Credit Institution Accounting Regulation (Verordnung über die Rechnungslegung der Kreditinstitute) are classified under "Other assets and liabilities" as of the December 2010 reporting date. Trading portfolio derivatives are listed separately in the Statistical Series Banking statistics, in Tables I.1 to I.3. 2 For building and loan associations: including deposits under savings

^{*} See Table IV.2, footnote *; statistical breaks have been eliminated from the changes. The figures for the latest date are always to be regarded as provisional. Subsequent revisions, which appear in the following Monthly Report, are not specially marked.

¹ Including subordinated liabilities and liabilities arising from registered debt securities.
2 Including deposits under savings and loan contracts (see Table IV.12). 3 Excluding deposits under savings and loan contracts (see also footnote 2).

7. Deposits of domestic non-banks (non-MFIs) at banks (MFIs) in Germany * (cont'd)

^{*} Excluding assets and liabilities and/or transactions of foreign branches. The figures for the latest date are always to be regarded as provisional. Subsequent revisions, which appear in the following Monthly Report, are not specially marked. 1 See Table IV2, footnote 1. 2 Including claims on building and loan associations, claims arising from registered debt securities and central bank credit balances. 3 Loans under savings and loan contracts and interim and bridging loans. 4 Including money market paper and small amounts of other securities issued by banks. 5 Including equalisation claims. 6 Including liabilities to building and loan associations. 7 Including small amounts of savings deposits. 8 Including participation rights capital and fund for general banking

risks. **9** Total amount covered by the contracts; only contracts newly entered into, for which the contract fee has been fully paid. Increases in the sum contracted count as new contracts. **10** For disbursements of deposits under savings and loan contracts arising from the allocation of contracts see "Capital disbursed". **11** Including housing bonuses credited. **12** Only allocations accepted by the beneficiaries; including allocations applied to settlement of interim and bridging loans. **13** The amounts already credited to the accounts of savers or borrowers are also included in "Amounts paid into savings and loan accounts" and "Interest and repayments received on building loans".

13. Assets and liabilities of the foreign branches and foreign subsidiaries of German banks (MFIs) *

¹ The reserve maintenance period starts on the settlement day of the main refinancing operation immediately following the meeting of the Governing Council of the ECB for which the discussion on the monetary policy stance is scheduled. 2 Article 5 of the Regulation (EU) 2021/378 of the European Central Bank on the application of minimum reserve requirements (excluding liabilities to which a reserve ratio of 0% applies, pursuant to Article 6(1)(a)). 3 Amount after applying the reserve ratio to the reserve base. The reserve ratio for liabilities with agreed maturities of up to two years was 2%

between 1 January 1999 and 17 January 2012. Since 18 January 2012, it has stood at 1%. **4** Article 6(2) of the Regulation (EU) 2021/378 of the European Central Bank on the application of minimum reserve requirements. **5** Average credit balances of credit institutions at national central banks. **6** Average credit balances less required reserves after deduction of the lump-sum allowance. **7** Required reserves after deduction of the lump-sum allowance.

^{*} The interest rate statistics gathered on a harmonised basis in the euro area from * The interest rate statistics gathered on a harmonised basis in the euro area from January 2003 are collected in Germany on a sample basis. The MFI interest rate statistics are based on the interest rates applied by MFIs and the related volumes of euro-denominated deposits and loans to households and non-financial corporations domiciled in the euro area. The household sector comprises individuals (including sole proprietors) and non-profit institutions serving households. Non-financial corporations include all enterprises other than insurance corporations, banks and other financial institutions. The most recent figures are in all cases to be readed as required as provisional. include all enterprises order than insurance corporations, banks and other financial institutions. The most recent figures are in all cases to be regarded as provisional. Subsequent revisions appearing in the following Monthly Report are not specially marked. Further information on the MFI interest rate statistics can be found on the Bundesbank's website (Statistics/Money and capital markets/Interest rates and yields/Interest rates on deposits and loans). • The statistics on outstanding amounts are collected at the end of the month. • The effective interest rates are calculated either as

annualised agreed interest rates or as narrowly defined effective rates. Both calculation annualised agreed interest rates or as narrowly defined effective rates. Both calculation methods cover all interest payments on deposits and loans but not any other related charges which may occur for enquiries, administration, preparation of the documents, guarantees and credit insurance. 2 Data based on monthly balance sheet statistics. 3 Secured and unsecured loans for home purchase, including building and home improvements; including loans granted by building and loan associations and interim credits as well as transmitted loans granted by the reporting agents in their own name and for their own account. 4 Loans for consumption are defined as loans granted for the purpose of personal use in the consumption of goods and services. 5 For the purpose of these statistics, other loans are loans granted for other purposes such as business, debt consolidation, education, etc. 6 Including overdrafts (see also footnotes business, debt consolidation, education, etc. 6 Including overdrafts (see also footnotes 12 to 14 on p. 47)

For footnotes * and 1 to 6, see p. 44°. For footnote x see p. 47°. + For deposits with an agreed maturity and all loans excluding revolving loans and overdrafts, credit card debt: new business covers all new agreements between households or non-financial corporations and the bank. The interest rates are calculated as volume-weighted average rates of all new agreements concluded during the reporting month. For overnight deposits, deposits redeemable at notice, revolving loans and overdrafts, credit card debt: new business is collected in the same way as outstanding amounts for the sake of simplicity. This means that all outstanding deposit and lending business at

the end of the month has to be incorporated in the calculation of average rates of interest. **7** Estimated. The volume of new business is extrapolated to form the underlying total using a grossing-up procedure. **8** Including non-financial corporations' deposits; including fidelity and growth premiums. **9** Excluding overdrafts. **10** Annual percentage rate of charge, which contains other related charges which may occur for enquiries, administration, preparation of the documents, guarantees and credit insurance

For footnotes * and 1 to 6, see p. 44°. For footnotes + and 7 to 10, see p. 45°; 11 For the purposes of the interest rate statistics, a loan is considered to be secured if collateral (amongst others financial collateral, real estate collateral, debt securities) in at least the same value as the loan amount has been posted, pledged or assigned. 12 Including revolving loans which have all the following features: (a) the borrower may use or withdraw the funds to a pre-approved credit limit without giving prior notice to the lender; (b) the amount of available credit can increase and decrease as funds are borrowed and repaid; (c) the loan may be used repeatedly; (d) there is no obligation of regular repayment of funds. 13 Overdrafts are defined as debit balances

on current accounts. They include all bank overdrafts regardless of whether they are within or beyond the limits agreed between customers and the bank. 14 Including convenience and extended credit card debt. Convenience credit is defined as the credit granted at an interest rate of 0% in the period between payment transactions effected with the card during one billing cycle and the date at which the debt balances from this specific billing cycle become due. 15 The amount category refers to the single loan transaction considered as new business. x Dominated by the business of one or two banks. Therefore, the value cannot be published due to confidentiality.

Sources: The calculations for the insurance sectors are based on supervisory data according to Solvency I and II and for pension funds on IORP supervisory data and own data collections. 1 Accounts receivable to monoteary financial institutions, including registered bonds, borrower's note loans and registered Pfandbriefe. 2 Including deposits retained on assumed reinsurance as well as registered bonds, borrower's note loans and registered Pfandbriefe. 3 Including reinsurance recoverables and claims of

pension funds on pension managers. **4** Not including the reinsurance business conducted by primary insurers, which is included there. **5** The term "pension funds" refers to the institutional sector "pension funds" of the European System of Accounts. Pension funds thus comprise company pension schemes and occupational pension schemes for the self-employed. Social security funds are not included.

Sources: The calculations for the insurance sectors are based on supervisory data according to Solvency I and II and for pension funds on IORP supervisory data and own data collections. 1 Including deposits retained on ceded business as well as registered bonds, borrower's note loans and registered Pfandbriefe. 2 Including claims of pension funds on pension managers and entitlements to non-pension benefits. 3 Technical reserves "life" taking account of transitional measures. Health insurance is also included

in the "non-life insurance" sector. **4** Not including the reinsurance business conducted by primary insurers, which is included there. **5** Valuation at book values. The term "pension funds" refers to the institutional sector "pension funds" of the European System of Accounts. Pension funds thus comprise company pension schemes and occupational pension schemes for the self-employed. Social security funds are not included. **6** Own funds correspond to the sum of "Net worth" and "Shares and other equity".

¹ Bearer debt securities with maximum maturities according to the terms of issue of over 4 years. Structured debt securities, debt securities with unscheduled redemption, zero coupon bonds, floating rate notes and bonds not denominated in Euro are not included. Group yields for the various categories of securities are weighted by the amounts outstanding of the debt securities included in the calculation. Monthly figures

are calculated on the basis of the yields on all the business days in a month. The annual figures are the unweighted means of the monthly figures. Adjustment of the scope of securities included on 1 May 2020. **2** Only debt securities eligible as underlying instruments for futures contracts; calculated as unweighted averages.

Sources: Federal Statistical Office and Bundesbank calculations. **1** The deficit/surplus in accordance with ESA 2010 corresponds to the Maastricht definition. In connection with the publication of the 2023 annual figures, no revised figures were released for the first

half of the year. Therefore, the 2023 half-year figures are not directly compatible with the annual figures. **2** Quarterly GDP ratios are based on the national output of the four preceding quarters.

Source: Bundesbank calculations based on Federal Statistical Office data. 1 Annual figures based on the quarterly figures of the Federal Statistical Office, core budgets and off-budget entities which are assigned to the general government sector. 2 The annual figures do not tally with the sum of the quarterly figures, as the latter are all provisional. The quarterly figures for some insurance sectors are estimated. 3 The development of the types of expenditure recorded here is influenced in part by statistical

changeovers. 4 Including discrepancies in clearing transactions between central, state and local government. 5 On the revenue side, this contains proceeds booked as disposals of equity interests and as loan repayments. On the expenditure side, this contains the acquisition of equity interests and loans granted. 6 Excluding central government liquidity assistance to the Federal Employment Agency.

Source: Federal Ministry of Finance and Bundesbank calculations. 1 This total, unlike that in Table X. 5, does not include the receipts from the equalisation of burdens levies, local business tax (less local business tax transfers to central and state government), real property taxes and other local government taxes, or the balance of untransferred tax shares. 2 Respective percentage share of central, state and local government in revenue: wage tax and assessed income tax 42.5:42.5:15, corporation tax and non-assessed taxes on earnings 50:50:-, final withholding tax on interest income and capital gains, non-assessed taxes on earnings 44:44:12. 3 After deducting child benefits and subsidies for supplementary private pension plans. 4 After deducting employee

refunds and research grants. **5** After deducting research grants. **6** Final withholding tax on interest income and capital gains, non-assessed taxes on earnings. **7** The allocation of revenue to central, state and local government, which is adjusted at more regular intervals, is regulated in Section 1 of the Revenue Adjustment Act. Respective percentage share of central, state and local government in revenue for 2023: 47.5:49.7:2.8. The EU share is deducted from central government's share. **8** Respective percentage share of central and state government for 2023: 41.4:58.6. **9** For the breakdown, see Table X. 7.

Sources: Federal Republic of Germany - Finance Agency, Federal Statistical Office, and Bundesbank calculations. 1 Comprises all of central government, i.e. all off-budget entities in addition to the core budget, including the government-owned bad bank FMS Wertmanagement and liabilities attributed to central government from an economic perspective under the European System of Accounts (ESA) 2010. 2 Particularly liabilities

resulting from coins in circulation. **3** Issuances by the Federal Republic of Germany. Excluding issuers' holdings of own securities but including those held by other government entities. **4** Including medium-term notes issued by the Treuhand agency (expired in 2011). **5** Including Federal Treasury financing papers (expired in 2014). **6** Excluding inflation-induced indexation of capital.

Sources: Federal Statistical Office; Federal Employment Agency. * Annual and quarterly figures: averages; calculated by the Bundesbank; deviations from the official figures are due to rounding. 1 Workplace concept; averages. 2 Monthly figures: end of month. 3 Number within a given month. 4 Mid-month level. 5 Relative to the total civilian labour force. 6 Excluding government-assisted forms of employment and seasonal jobs, including jobs located abroad. 7 Statistical break due to late recording of unemployed persons in the legal category of the Second Book of the Social Security Code (SGB II).

8 Initial preliminary estimate by the Federal Statistical Office. **9** From May 2023, calculated on the basis of new labour force figures. **10** Unadjusted figures estimated by the Federal Employment Agency. In 2021 and 2022, the estimated values for Germany deviated from the final data by a maximum of 0.1% for employees subject to social contributions, by a maximum of 0.5% for persons solely in jobs exempt from social contributions, and by a maximum of 61,3% for cyclically induced short-time work.

^{*} Non-financial groups admitted to the Prime Standard segment of the Frankfurt Stock Exchange which publish IFRS consolidated financial statements on a quarterly or half-yearly basis and make a noteworthy contribution to value added in Germany. Excluding groups engaged in real estate activities. 1 Earnings before interest, taxes, depreciation and amortisation. 2 Quantile data are based on the groups' unweighted return on sales. 3 Annual figures do not always match the sum of the two half-year fig-

ures. See Quality report on consolidated financial statement statistics, p. 3. **4** Adjusted for substantial changes in the basis of consolidation of large groups and in the reporting sample. See Quality report on consolidated financial statement statistics, p. 6. **5** Including groups in agriculture and forestry. **6** From 2018 onwards: significant changes in IFRS standards, impairing comparability with previous periods.

^{*} Assets and liabilities vis-à-vis all countries within and outside the euro area. Up to December 2000 the levels at the end of each quarter are shown, owing to revaluations, at market prices; within each quarter, however, the levels are computed on the basis of cumulative transaction values. From January 2001 all end-of-month levels are valued at market prices. 1 Mainly net claims on TARGET2 balances (acc. to the respective country designation), since November 2000 also balances with non-euro area central banks

within the ESCB. 2 Mainly long-term debt securities from issuers within the euro area. 3 Including estimates of currency in circulation abroad. 4 See Deutsche Bundesbank, Monthly Report, October 2014, p. 22. 5 Difference between External assets and External liabilities. 6 Euro opening balance sheet of the Bundesbank as at 1 January

8. External positions of enterprises *

^{*} The effective exchange rate corresponds to the weighted external value of the currency concerned. The method of calculating the indicators of the German economy's price competitiveness is consistent with the procedure to compute the effective exchange rates of the euro. A decline in the figures implies an increase in competitiveness. The weights are based on trade in manufactured goods and services. For more detailed information on methodology and weighting scale, see the website of the Deutsche Bundesbank (https://www.bundesbank.de/content/796162). 1 The calculations are based on the weighted averages of the changes in the bilateral exchange rates of the euro vis-à-vis the currencies of the following 18 countries: Australia, Bulgaria, Canada, China, Czechia, Denmark, Hong Kong, Hungary, Japan, Norway, Poland, Romania, Singapore, South Korea, Sweden, Switzerland, the United Kingdom and the United States. Where current price and wage indices were not available, estimates were used.

2 Includes countries belonging to the extended EER group of trading partners (fixed composition) and additionally the following 23 countries: Algeria, Argentina, Brazil, Chile, Colombia, Iceland, India, Indonesia, Israel, Malaysia, Mexico, Morocco, New Zealand, Peru, Philippines, the Russian Federation, Saudi Arabia, South Africa, Taiwan,

Thailand, Turkey, Ukraine and United Arab Emirates. The ECB has suspended the publication and calculation of the euro foreign exchange reference rate against Russian rouble with effect from March 2, 2022 until further notice. For the calculation of effective exchange rates, an indicative rate is used for the Russian Federation from that date. It is calculated from the daily RUB/USD rates determined by the Bank of Russia in conjunction with the respective ECB's euro foreign exchange reference rate to the US dollar. 3 Annual and quarterly averages. 4 Euro area countries (from 2001 including Greece, from 2007 including Slovenia, from 2008 including Cyprus and Malta, from 2009 including Slovakia, from 2011 including Estonia, from 2014 including Latvia, from 2015 including Lithuania, from 2023 including Croatia) as well as Canada, Denmark, Japan, Norway, Sweden, Switzerland, the United Kingdom and the United States. 5 Euro area countries (current composition) and countries belonging to the extended EER group of trading partners (fixed comosition). 6 Euro area countries (current composition) and countries belonging to the broad EER group of trading partners (fixed comosition).

Deutsche Bundesbank Monthly Report February 2024 84°

Overview of publications by the Deutsche Bundesbank

This overview provides information about selected recent economic and statistical publications by the Deutsche Bundesbank. Unless otherwise indicated, these publications are available in both English and German, in printed form and on the Bundesbank's website.

The printed publications are available free of charge to interested parties and may be obtained through the Bundesbank's order portal. Up-to-date figures for selected statistical datasets are available on the Bundesbank's website, as are also the Statistical Series, with a changed basic structure and advanced options for using data.

■ Financial Stability Review

Monthly Report

A list of the articles published in the period from 2010 to 2022 is available on the Bundesbank's website

Monthly Report articles

April 2023

- Money market conditions and remuneration of government deposits
- Household wealth and finances in Germany:
 Results of the 2021 household wealth survey
- Turning point in payments
- Sustainability risks in banking supervision

May 2023

- The current economic situation in Germany

June 2023

 Arduous recovery amid high and only gradually easing inflation – outlook for the German economy up to 2025

- Developments in bank interest rates in Germany during the period of monetary policy tightening
- The growing significance of central government's off-budget entities

July 2023

- Digital money: options for the financial industry
- Cross-border liquidity flows the role of the banking system in the German balance of payments
- Economic developments in emerging market economies: old problems and new challenges

August 2023

The current economic situation in Germany

September 2023

- Germany as a business location: selected aspects of current dependencies and medium-term challenges
- Heterogeneous impact of monetary policy in the euro area?
- Models for short-term economic forecasting during the recent crises
- Member States' financial relationships with the EU budget and the NextGenerationEU off-budget entity in 2022

The performance of German credit institutions in 2022

October 2023

- Is price competitiveness favourable in Germany and the euro area?
- State government finances in 2022: high surplus overall, some states still making extensive recourse to emergency borrowing

November 2023

- The current economic situation in Germany

December 2023

- Falling inflation, but not yet time to sound the all-clear – outlook for the German economy up to 2026
- Model-based recommendations for monetary policy decision-making
- German enterprises' profitability and financing during the 2022 energy crisis
- Tackling the challenges of crypto-assets the state of play with regulation

January 2024

- Risks facing Germany as a result of its economic ties with China
- The outlook for cash a systematic look at the future of cash

February 2024

- The current economic situation in Germany

Statistical Series*

Banks

- Banking statistics, monthly
- Statistics on payments and securities trading,
 September

Corporate financial statements

- Consolidated financial statement statistics,
 June/December
