3 Additional Information

3.1 DWH Data Reload

**DWH Data Reload required*

The recent updates in DWH contain modifications to the ETL (Extract, Transform, Load) process. These changes will be applied to new data upon the deployment, but will not retroactively correct historical data processed and stored before.

Without a data reload, historical data will remain incorrect. Therefore, reload activities aim to correct this data after the deployment, ensuring that the pre-deployment values are also corrected and the reports return correct results.

Consequently, the effectiveness of these updates can only be evaluated using data from business days following the deployment. Historical data will remain unchanged and should only be considered accurate if it was not affected by the ETL issues or after the data reprocessing and reload have been completed.

The reprocessing of the data will be executed during the weekend after the deployment and ensures that data is reloaded and corrected. This means that as of Wednesday 17.06.2026 after the deployment, also the previous data will be displayed correctly in the reports.

In case of unforeseen circumstances that hamper the mentioned reprocessing during the weekend, 4CB will provide appropriate information.

3.2 Regression risk

The regression risk for this release is considered low according to the non-regression tests performed. Non regression tests for CoCo CRs and PBIs originated in other TS are conducted by the service provider of the service where the changes originated, and these should be sufficient to address potential regressions for all the services using the CoCos.
